## **Protein Kinase Modulators and Methods of Use**

### **BACKGROUND OF THE INVENTION**

#### **Field of the Invention**

[001] This invention relates to compounds for modulating protein kinase enzymatic activity for modulating cellular activities such as proliferation, differentiation, programmed cell death, migration and chemoinvasion, and to pharmaceutical compositions containing such compounds. Even more specifically, the invention relates to compounds that inhibit, regulate and/or modulate kinases, particularly Checkpoint Kinases, even more particularly Checkpoint Kinase 1, or Chk1. Methods of therapeutically or prophylactically using the compounds and compositions to treat kinase-dependent diseases and conditions are also an aspect of the invention, and include methods of treating cancer, as well as other disease states associated with unwanted angiogenesis and/or cellular proliferation, by administering effective amounts of such compounds.

#### **Summary of Related Art**

[002] Cells reproduce by duplicating their contents and then dividing in two. This cell division cycle is the fundamental means by which all living things are propagated. In unicellular species, such as bacteria and yeasts, each cell division produces an additional organism. In multicellular species many rounds of cell division are required to make a new individual, and cell division is needed in the adult body too, to replace cells that are lost by wear and tear or by programmed cell death. Thus an adult human must manufacture many millions of new cells each second simply to maintain the status quo, and if all cell division is halted – for example, by a large dose of ionizing radiation – the individual will die within a few days.

[003] The cell division cycle is the subject of a control system that coordinates the cycle as a whole. A multitude of genes, proteins and other cellular machinery directly or indirectly regulate progression of a cell through the cell division cycle. Regulatory elements can either help stimulate an increase in cell numbers or help to inhibit it. Uncontrolled cell proliferation is the insignia of cancer, and can be manifested by a

deregulation of the cell division cycle in one of two ways - making stimulatory genes hyperactive or inhibitory genes inactive.

- [004] It can be understood, therefore, that agents that modulate the cell cycle, and thus hyperproliferation, could be used to treat various disease states associated with uncontrolled or unwanted cell proliferation. In addition to oncological indications, altered cell cycle division signaling is implicated in numerous other pathological diseases. These include, but are not limited to antiparasitics (See, Gray et al., *Curr. Med. Chem.* 6, 859-875 (1999)); potential antivirals (See, Schang et al., *J. Virol.* 74, 2107-2120 (2000)); cardiovascular maladies such as atherosclerosis or restenosis (See Braun-Dullaeus et al., *Circulation*, 98, 82-89 (1998)); and states of inflammation and immunological disorders, such as arthritis (See, Taniguchi et al., *Nature Med.*, 5, 760-767(1999)) or psoriasis.
- [005] Mechanisms of cell proliferation are under active investigation at cellular and molecular levels. At the cellular level, de-regulation of signaling pathways, loss of cell cycle controls, unbridled angiogenesis or stimulation of inflammatory pathways are under scrutiny, while at the molecular level, these processes are modulated by various proteins, among which protein kinases are prominent suspects. Overall abatement of proliferation may also result from programmed cell death, or apoptosis, which is also regulated via multiple pathways, some involving proteolytic enzyme proteins. Among the candidate regulatory proteins, protein kinases are a family of enzymes that catalyze phosphorylation of proteins, in particular the hydroxyl group of specific tyrosine, serine, or threonine residues in proteins. The consequences of this seemingly simple activity are staggering, and typically, such phosphorylation dramatically perturbs the function of the protein, and thus protein kinases are pivotal in the regulation of a wide variety of cellular processes, including metabolism, cell proliferation, cell differentiation, and cell survival. Of the many different cellular functions in which the activity of protein kinases is known to be required, some processes represent attractive targets for therapeutic intervention for certain disease states. Two examples are cell-cycle control and angiogenesis, in which protein kinases play a pivotal role; these processes are essential for the growth of solid tumors as well as for other diseases.
- [006] CDKs constitute a class of enzymes that play critical roles in regulating the transitions between different phases of the cell cycle, such as the progression from a quiescent stage in G.sub.1 (the gap between mitosis and the onset of DNA replication for a new round of cell division) to S (the period of active DNA synthesis), or the progression

from G.sub.2 to M phase, in which active mitosis and cell-division occur. See, e.g., the articles compiled in *Science*, vol. 274 (1996), pp. 1643-1677; and *Ann. Rev. Cell Dev. Biol.*, vol. 13 (1997), pp. 261-291. CDK complexes are formed through association of a regulatory cyclin subunit (e.g., cyclin A, B1, B2, D1, D2, D3, and E) and a catalytic kinase subunit (e.g., cdc2 (CDK1), CDK2, CDK4, CDK5, and CDK6). As the name implies, the CDKs display an absolute dependence on the cyclin subunit in order to phosphorylate their target substrates, and different kinase/cyclin pairs function to regulate progression through specific portions of the cell cycle.

[007] The D cyclins are sensitive to extracellular growth signals and become activated in response to mitogens during the G.sub.1 phase of the cell cycle. CDK4/cyclin D plays an important role in cell cycle progression by phosphorylating, and thereby inactivating, the retinoblastoma protein (Rb). Hypophosphorylated Rb binds to a family of transcriptional regulators, but upon hyperphosphorylation of Rb by CDK4/cyclin D, these transcription factors are released to activate genes whose products are responsible for S phase progression. Rb phosphorylation and inactivation by CDK4/cyclin D permit passage of the cell beyond the restriction point of the G.sub.1 phase, whereupon sensitivity to extracellular growth or inhibitory signals is lost and the cell is committed to cell division. During late G.sub.1, Rb is also phosphorylated and inactivated by CDK2/cyclin E, and recent evidence indicates that CDK2/cyclin E can also regulate progression into S phase through a parallel pathway that is independent of Rb phosphorylation (see Lukas et al., "Cyclin E-induced S Phase Without Activation of the pRb/E2F Pathway," *Genes and Dev.*, vol. 11 (1997), pp. 1479-1492).

[008] The progression from G.sub.1 to S phase, accomplished by the action of CDK4/cyclin D and CDK2/cyclin E, is subject to a variety of growth regulatory mechanisms, both negative and positive. Growth stimuli, such as mitogens, cause increased synthesis of cyclin D1 and thus increased functional CDK4. By contrast, cell growth can be "reined in," in response to DNA damage or negative growth stimuli, by the induction of endogenous inhibitory proteins. These naturally occurring protein inhibitors include p.sub.21.sup.WAF1/CIP1, p27.sup.KIP1, and the p16.sup.INK4 family, the latter of which inhibit CDK4 exclusively (see Harper, "Cyclin Dependent Kinase Inhibitors," *Cancer Surv.*, vol. 29 (1997), pp. 91-107). Aberrations in this control system, particularly those that affect the function of CDK4 and CDK2, are implicated in the advancement of cells to the highly proliferative state characteristic of malignancies, such as familial

melanomas, esophageal carcinomas, and pancreatic cancers (see, e.g., Hall and Peters, "Genetic Alterations of Cyclins, Cyclin-Dependent Kinases, and CDK Inhibitors in Human Cancer," *Adv. Cancer Res.*, vol. 68 (1996), pp.67-108; and Kamb et al., "A Cell Cycle Regulator Potentially Involved in Genesis of Many Tumor Types," *Science*, vol. 264 (1994), pp. 436-440).

[009] Over-expression of cyclin D1 is linked to esophageal, breast, and squamous cell carcinomas (see, e.g., DelSal et al., "Cell Cycle and Cancer: Critical Events at the G.sub.1 Restriction Point," *Critical Rev. Oncogenesis*, vol. 71 (1996), pp. 127-142). Genes encoding the CDK4-specific inhibitors of the p16 family frequently have deletions and mutations in familial melanoma, gliomas, leukemias, sarcomas, and pancreatic, non-small cell lung, and head and neck carcinomas (see Nobori et al., "Deletions of the Cyclin-Dependent Kinase-4 Inhibitor Gene in Multiple Human Cancers," *Nature*, vol. 368 (1994), pp. 753-756). Amplification and/or overexpression of cyclin E has also been observed in a wide variety of solid tumors, and elevated cyclin E levels have been correlated with poor prognosis. In addition, the cellular levels of the CDK inhibitor p27, which acts as both a substrate and inhibitor of CDK2/cyclin E, are abnormally low in breast, colon, and prostate cancers, and the expression levels of p27 are inversely correlated with the stage of disease (see Loda et al., "Increased Proteasome-dependent Degradation of the Cyclin-Dependent Kinase Inhibitor p27 in Aggressive Colorectal Carcinomas," *Nature Medicine*, vol. 3 (1997), pp. 231-234). Recently there is evidence that CDK4/cyclin D might sequester p27, as reviewed in Sherr, et al., *Genes Dev.*, Vol. 13 (1999), pp. 1501-1512. The p21 proteins also appear to transmit the p53 tumor-suppression signal to the CDKs; thus, the mutation of p53 in approximately 50% of all human cancers may indirectly result in deregulation of CDK activity.

[010] In at least one instance modulation of protein kinase activity as been used as a treatment for an oncological condition. For example, modulation of protein kinase activity for the treatment of chronic myeloid leukemia (CML) and gastrointestinal stroma cancers has been demonstrated successfully with the FDA approval of Gleevec® (imatinib mesylate, produced by Novartis Pharmaceutical Corporation of East Hanover, NJ). Gleevec is a selective Abl kinase inhibitor.

[011] Another series of protein kinases are those that play an important role as a checkpoint in cell cycle progression. See, e.g., Melo et al., *Current Opinion in Cell Biology* 2002, 14:237-245 (2003). Proliferation of eukaryotic cells is controlled by cell

cycle checkpoint pathways, which mediate progression through critical transitions of the cell cycle (reviewed by Walworth (2000), *Curr. Opin. Cell Biol.* 12, 697-704). Checkpoints prevent cell cycle progression at inappropriate times, such as in response to DNA damage, and maintain the metabolic balance of cells while the cell is arrested, and in some instances can induce apoptosis (programmed cell death) when the requirements of the checkpoint have not been met. See, e.g., O'Connor, *Cancer Surveys*, 29, 151-182 (1997); Nurse, *Cell*, 91, 865-867 (1997); Hartwell et al., *Science*, 266, 1821-1828 (1994); Hartwell et al., *Science*, 246, 629-634 (1989). Checkpoint control can occur in the G1 phase (prior to DNA synthesis) and in G2, prior to entry into mitosis.

[012] One series of checkpoints monitors the integrity of the genome and, upon sensing DNA damage, these "DNA damage checkpoints" block cell cycle progression in G.sub.1 & G.sub.2 phases, and slow progression through S phase. O'Connor, *Cancer Surveys*, 29, 151-182 (1997); Hartwell et al., *Science*, 266, 1821-1828 (1994). This action enables DNA repair processes to complete their tasks before replication of the genome and subsequent separation of this genetic material into new daughter cells takes place. Importantly, the most commonly mutated gene in human cancer, the p53 tumor suppressor gene, produces a DNA damage checkpoint protein that blocks cell cycle progression in G.sub.1 phase and/or induces apoptosis (programmed cell death) following DNA damage. Hartwell et al., *Science*, 266, 1821-1828 (1994). The p53 tumor suppressor has also been shown to strengthen the action of a DNA damage checkpoint in G.sub.2 phase of the cell cycle. See, e.g., Bunz et al., *Science*, 28, 1497-1501 (1998); Winters et al., *Oncogene*, 17, 673-684 (1998); Thompson, *Oncogene*, 15, 3025-3035 (1997).

[013] Given the pivotal nature of the p53 tumor suppressor pathway in human cancer, therapeutic interventions that exploit vulnerabilities in p53-defective cancer have been actively sought. One emerging vulnerability lies in the operation of the G.sub.2 checkpoint in p53 defective cancer cells. Cancer cells, because they lack G.sub.1 checkpoint control, are particularly vulnerable to abrogation of the last remaining barrier protecting them from the cancer killing effects of DNA-damaging agents: the G.sub.2 checkpoint. The G.sub.2 checkpoint is regulated by a control system that has been conserved from yeast to humans. Important in this conserved system is a kinase, CHK1, which transduces signals from the DNA-damage sensory complex to inhibit activation of the cyclin B/Cdc2 kinase, which promotes mitotic entry. See, e.g., Peng et al., *Science*, 277, 1501-1505 (1997); Sanchez et al., *Science*, 277, 1497-1501 (1997). Inactivation of

CHK1 has been shown to both abrogate G.sub.2 arrest induced by DNA damage inflicted by either anticancer agents or endogenous DNA damage, as well as result in preferential killing of the resulting checkpoint defective cells. See, e.g., Nurse, *Cell*, 91, 865-867 (1997); Weinert, *Science*, 277, 1450-1451 (1997); Walworth et al., *Nature*, 363, 368-371 (1993); and Al-Khodairy et al., *Molec. Biol. Cell.*, 5, 147-160 (1994).

[014] Selective manipulation of checkpoint control in cancer cells could afford broad utilization in cancer chemotherapeutic and radiotherapy regimens and may, in addition, offer a common hallmark of human cancer "genomic instability" to be exploited as the selective basis for the destruction of cancer cells. A number of factors place CHK1 as a pivotal target in DNA-damage checkpoint control. The elucidation of inhibitors of this and functionally related kinases such as CDS1/CHK2, a kinase recently discovered to cooperate with CHK1 in regulating S phase progression (see Zeng et al., *Nature*, 395, 507-510 (1998); Matsuoka, *Science*, 282, 1893-1897 (1998)), could provide valuable new therapeutic entities for the treatment of cancer.

[015] Another group of kinases are the tyrosine kinases. Tyrosine kinases can be of the receptor type (having extracellular, transmembrane and intracellular domains) or the non-receptor type (being wholly intracellular). At least one of the non-receptor protein tyrosine kinases, namely, LCK, is believed to mediate the transduction in T-cells of a signal from the interaction of a cell-surface protein (Cd4) with a cross-linked anti-Cd4 antibody. A more detailed discussion of non-receptor tyrosine kinases is provided in Bolen, *Oncogene*, 8, 2025-2031 (1993), which is incorporated herein by reference.

[016] Receptor-type tyrosine kinases are comprised of a large number of transmembrane receptors with diverse biological activity. In fact, about 20 different subfamilies of receptor-type tyrosine kinases have been identified. One tyrosine kinase subfamily, designated the HER subfamily, is comprised of EGFR (HER1), HER2, HER3, and HER4. Ligands of this subfamily of receptors identified so far include epithelial growth factor, TGF-alpha, amphiregulin, HB-EGF, betacellulin and heregulin. Another subfamily of these receptor-type tyrosine kinases is the insulin subfamily, which includes INS-R, IGF-IR, and IR-R. The PDGF subfamily includes the PDGF-alpha and beta receptors, CSFIR, c-kit and FLK-II. Then there is the FLK family, which is comprised of the kinase insert domain receptor (KDR), fetal liver kinase-1 (FLK-1), fetal liver kinase-4 (FLK-4) and the fms-like tyrosine kinase-1 (flt-1). The PDGF and FLK families are usually considered together due to the similarities of the two groups. For a detailed discussion of the

receptor-type tyrosine kinases, see Plowman et al., *DN&P* 7(6): 334-339, 1994, which is hereby incorporated by reference.

[017] The non-receptor type of tyrosine kinases is also comprised of numerous subfamilies, including Src, Frk, Btk, Csk, Abl, Zap70, Fes/Fps, Fak, Jak, Ack, and LIMK. Each of these subfamilies is further sub-divided into varying receptors. For example, the Src subfamily is one of the largest and includes Src, Yes, Fyn, Lyn, Lck, Blk, Hck, Fgr, and Yrk. The Src subfamily of enzymes has been linked to oncogenesis. For a more detailed discussion of the non-receptor type of tyrosine kinases, see Bolen, *Oncogene*, 8:2025-2031 (1993), which is hereby incorporated by reference.

[018] In addition to its role in cell-cycle control, protein kinases also play a crucial role in angiogenesis, which is the mechanism by which new capillaries are formed from existing vessels. When required, the vascular system has the potential to generate new capillary networks in order to maintain the proper functioning of tissues and organs. In the adult, however, angiogenesis is fairly limited, occurring only in the process of wound healing and neovascularization of the endometrium during menstruation. See Merenmies, J., Parada, L. F., Henkemeyer, M., *Cell Growth & Differentiation*, 8, 3-10 (1997). On the other hand, unwanted angiogenesis is a hallmark of several diseases, such as retinopathies, psoriasis, rheumatoid arthritis, age-related macular degeneration, and cancer (solid tumors). Folkman, *Nature Med.*, 1, 27-31 (1995). Protein kinases which have been shown to be involved in the angiogenic process include three members of the growth factor receptor tyrosine kinase family: VEGF-R2 (vascular endothelial growth factor receptor 2, also known as KDR (kinase insert domain receptor) and as FLK-1); FGF-R (fibroblast growth factor receptor); and TEK (also known as Tie-2).

[019] VEGF-R2, which is expressed only on endothelial cells, binds the potent angiogenic growth factor VEGF and mediates the subsequent signal transduction through activation of its intracellular kinase activity. Thus, it is expected that direct inhibition of the kinase activity of VEGF-R2 will result in the reduction of angiogenesis even in the presence of exogenous VEGF (see Strawn et al., *Cancer Research*, 56, 3540-3545 (1996)), as has been shown with mutants of VEGF-R2 which fail to mediate signal transduction. Millauer et al., *Cancer Research*, 56, 1615-1620 (1996). Furthermore, VEGF-R2 appears to have no function in the adult beyond that of mediating the angiogenic activity of VEGF. Therefore, a selective inhibitor of the kinase activity of VEGF-R2 would be expected to exhibit little toxicity.

[020] Similarly, FGF-R binds the angiogenic growth factors aFGF and bFGF and mediates subsequent intracellular signal transduction. Recently, it has been suggested that growth factors such as bFGF may play a critical role in inducing angiogenesis in solid tumors that have reached a certain size. Yoshiji et al., *Cancer Research*, 57, 3924-3928 (1997). Unlike VEGF-R2, however, FGF-R is expressed in a number of different cell types throughout the body and may or may not play important roles in other normal physiological processes in the adult. Nonetheless, systemic administration of a small molecule inhibitor of the kinase activity of FGF-R has been reported to block bFGF-induced angiogenesis in mice without apparent toxicity. Mohammad et al., *EMBO Journal*, 17, 5996-5904 (1998).

[021] TEK (also known as Tie-2) is another receptor tyrosine kinase expressed only on endothelial cells which has been shown to play a role in angiogenesis. The binding of the factor angiopoietin-1 results in autophosphorylation of the kinase domain of TEK and results in a signal transduction process which appears to mediate the interaction of endothelial cells with peri-endothelial support cells, thereby facilitating the maturation of newly formed blood vessels. The factor angiopoietin-2, on the other hand, appears to antagonize the action of angiopoietin-1 on TEK and disrupts angiogenesis. Maisonpierre et al., *Science*, 277, 55-60 (1997).

[022] As a result of the above-described developments, it has been proposed to treat angiogenesis by the use of compounds inhibiting the kinase activity of VEGF-R2, FGF-R, and/or TEK. For example, WIPO International Publication No. WO 97/34876 discloses certain cinnoline derivatives that are inhibitors of VEGF-R2, which may be used for the treatment of disease states associated with abnormal angiogenesis and/or increased vascular permeability such as cancer, diabetes, psoriasis, rheumatoid arthritis, Kaposi's sarcoma, haemangioma, acute and chronic nephropathies, atheroma, arterial restinosis, autoimmune diseases, acute inflammation and ocular diseases with retinal vessel proliferation.

[023] In addition to the protein kinases identified above, many other protein kinases have been considered to be therapeutic targets, and numerous publications disclose inhibitors of kinase activity, as reviewed in the following: McMahon et al., *Oncologist*, 5, 3-10 (2000); Garcia-Echeverria et al., *Med. Res. Rev.*, 20, 28-57 (2000); Holash et al., *Oncogene*, 18, 5356-5362 (1999); Stover et al., *Curr. Opin. Drug Disc. Dev.*, 2, 274-285 (1999); Toledo et al., *Curr Med. Chem.*, 6, 775-805 (1999); Thomas et al., *J. Biol. Chem.*,

274, 36684-36692 (1992); Cohen, *Curr. Op. Chem. Biol.*, 10, 544-549 (1999); Adams et al., *Curr. Opin. Drug Disc. Dev.*, 2, 96-109 (1999); McMahon et al., *Curr. Opin. Drug Disc. Dev.*, 1, 131-146 (1998); and Strawn et al., *Exp. Opin. Invest. Drugs*, 7, 553-573 (1998).

[024] It can be understood, therefore, that there is a need, for effective inhibitors of protein kinases in order to treat or prevent disease states associated with abnormal cell proliferation. Moreover, as would be understood by those skilled in the art, it is desirable for kinase inhibitors to possess both high affinity for the target kinase as well as high selectivity versus other protein kinases. Small-molecule compounds that may be readily synthesized and are potent inhibitors of cell proliferation are those, for example, that are inhibitors of one or more protein kinases, such as CHK1, CHK2, VEGF, CDKs or CDK/cyclin complexes and both receptor and non-receptor tyrosine kinases.

#### SUMMARY OF THE INVENTION

[025] Based on the aforementioned evidence, we contemplated that highly specific inhibitors of protein kinase, such as Chk1 kinase, will have a synergistic cytotoxic effect with DNA damaging agents in many kinds of tumor cells, whilst not causing excessive toxicity in non-tumor cells. Thus, one aspect of the invention is selective protein kinase modulators, particularly inhibitors like Chk1. Methods of the invention include both use of such compounds in a synergistic fashion as mention, and also as single agents for cancer therapy.

[026] We have unexpectedly found that analogs of 3-amino-pyrazine-2-carboxamide and related compounds effectively inhibit protein kinases such as Chk1 kinase. The compounds disclosed herein are useful for inhibiting the protein kinase and, therefore, useful for studying the role of protein kinase in various biological pathways as well as to augment the efficacy of cancer therapeutics, including DNA damaging agents. Accordingly, the invention also comprises pharmaceutical compositions comprising the compounds of the invention, as well as methods of using compounds of the invention to inhibit protein kinase and thereby modulate kinase dependent diseases or conditions.

[027] In another aspect, the invention provides methods of screening for modulators of kinase activity. The methods comprise combining a composition of the invention, a

kinase, and at least one candidate agent and determining the effect of the candidate agent on the kinase activity.

[028] In yet another aspect, the invention also provides pharmaceutical kits comprising one or more containers filled with one or more of the ingredients of pharmaceutical compounds and/or compositions of the present invention, including, one or more kinase enzyme activity modulators as described herein. ### **DETAILED DESCRIPTION OF THE INVENTION**

[031] The compounds set forth in the detailed description are useful as pharmaceuticals in mammals, especially humans, for modulating protein kinase enzymatic activity for modulating cellular activities such as uncontrolled, abnormal, or unwanted proliferation, differentiation, programmed cell death, migration and chemoinvasion. It is appreciated, however, that in some cases the cells may not be in a hyper- or hypo- proliferative and/or migratory state (abnormal state) and still require treatment. For example, during wound healing, the cells may be proliferating "normally," but proliferation and migration enhancement may be desired. Alternatively, reduction in "normal" cell proliferation and/or migration rate may be desired. Furthermore, such compounds may be used to prevent de-differentiation of post-mitotic tissue and/or cells.

[032] Diseases or disorders associated with uncontrolled, abnormal, and/or unwanted cellular activities, especially cellular proliferation include, but are not limited to the conditions set forth in the background and to the following:

- [033] a variety of cancers, including, but not limited to carcinoma, hematopoietic tumors of lymphoid lineage, hematopoietic tumors of myeloid lineage, tumors of mesenchymal origin, tumors of the central and peripheral nervous system and other tumors including melanoma, seminoma and Kaposi's sarcoma and the like, and those further discussed below;
- [034] a disease process which features abnormal cellular proliferation, e.g., benign prostatic hyperplasia, familial adenomatosis polyposis, neuro-fibromatosis, pulmonary fibrosis, hypertrophic scar formation, transplantation rejection, nodosum, endotoxic shock, and a variety of cardiovascular indications, including, but not limited to atherosclerosis, dysregulated vascularization including ischemic coronary artery disease, myocardioinfarction, ischemia, pulmonary hypertension, stroke, emphysema, anemia, and restenosis following angioplasty or vascular surgery;
- [035] an immune and/or inflammatory disorder, especially those involving immunological defects associated with aberrant B & T cell development. Such disorders can include, but are not limited to, acquired immunodeficiency syndrome (AIDS), Addison's disease, adult respiratory distress syndrome, allergies, ankylosing spondylitis, amyloidosis, asthma, autoimmune hemolytic anemia, autoimmune thyroiditis, Crohn's disease, episodic lymphopenia with lymphocytotoxins, erythroblastosis fetalis, Goodpasture's syndrome, Graves' disease, Hashimoto's thyroiditis, hypereosinophilia, irritable bowel syndrome and other interbowel diseases, Lupus, myasthenia gravis, myocardial or pericardial inflammation, pancreatitis, polymyositis, psoriasis, Reiter's syndrome, scleroderma, systemic anaphylaxis, ulcerative colitis, nephritis (including glomerulonephritis), gout, arthritis (such as rheumatoid arthritis and osteoarthritis), erythema, dermatitis, dermatomyositis, bronchitis, cholecystitis, and gastritis;
- [036] a disorder of carbohydrate metabolism, including but not limited to diabetic (including diabetes mellitus, diabetic retinopathy);
- [037] a parasitic, fungal and/or viral infection, including but not limited to herpes virus, poxvirus, Epstein-Barr virus, Sindbis virus and adenovirus, HIV, human papilloma virus; and
- [038] a neurodegenerative disorder, including but not limited to, Alzheimer's disease, amyotrophic lateral sclerosis, retinitis pigmentosa, Parkinson's disease, AIDS-related dementia, spinal muscular atrophy and cerebellar degeneration, myelodysplastic

syndromes, degenerative diseases of the musculoskeletal system (including but not limited to osteoporosis), cystic fibrosis, macular degeneration, and multiple sclerosis.

### Definitions

[092] As used in the present specification, the following words and phrases are generally intended to have the meanings as set forth below, except to the extent that the context in which they are used indicates otherwise or they are expressly defined to mean something different.

[093] "Alkyl" is intended to include linear, branched, or cyclic hydrocarbon structures and combinations thereof, inclusively. For example, "C<sub>8</sub> alkyl" may refer to an *n*-octyl, *iso*-octyl, cyclohexylethyl, and the like. Lower alkyl refers to alkyl groups of from one to eight carbon atoms. Examples of lower alkyl groups include methyl, ethyl, propyl, isopropyl, butyl, *s*-butyl, *t*-butyl, isobutyl, pentyl, cyclopentyl, hexyl, cyclohexyl, and the like. Higher alkyl refers to alkyl groups containing more than 6 carbon atoms. Exemplary alkyl groups are those of C<sub>20</sub> or below. Cycloalkyl is a subset of alkyl and includes cyclic hydrocarbon groups of from 3 to 13 carbon atoms. Examples of cycloalkyl groups include *c*-propyl, *c*-butyl, *c*-pentyl, norbornyl, adamantyl and the like. Cycloalkyl rings may have unsaturation but are not aromatic. In this application, alkyl refers to alkanyl, alkenyl, and alkynyl residues (and combinations thereof); it is intended to include cyclohexylmethyl, vinyl, allyl, isoprenyl, and the like. Thus when an alkyl residue having a specific number of carbons is named, all geometric isomers having that number of carbons are intended to be encompassed; thus either "butyl" or "C<sub>4</sub>alkyl" is meant to include *n*-butyl, *sec*-butyl, isobutyl, *t*-butyl, isobutenyl and but-2-yne radicals, for example; "propyl" or "C<sub>3</sub>alkyl" each include *n*-propyl, propenyl, and isopropyl, for example. Alkyls with variable numbers of carbons may be named by using number ranges as subscripts, as for example, lower alkyl is equivalent to C<sub>1-8</sub>alkyl.

- [094] "Alkylene" refers to straight or branched chain divalent radical consisting solely of carbon and hydrogen atoms, containing no unsaturation and having from one to ten carbon atoms, e.g., methylene, ethylene, propylene, n-butylene and the like. Alkylene is a subset of alkyl, referring to the same residues as alkyl, but having two points of attachment and specifically fully saturated. Examples of alkylene include ethylene ( $-\text{CH}_2\text{CH}_2-$ ), propylene ( $-\text{CH}_2\text{CH}_2\text{CH}_2-$ ), 2-dimethylpropylene ( $-\text{CH}_2\text{C}(\text{CH}_3)_2\text{CH}_2-$ ), and 2-cyclohexylpropylene ( $-\text{CH}_2\text{CH}(\text{C}_6\text{H}_{11})\text{CH}_2-$ ).
- [095] "Alkylidene" refers to a straight or branched chain unsaturated divalent radical consisting solely of carbon and hydrogen atoms, having from two to ten carbon atoms, e.g., ethylidene, propylidene, n-butylidene, and the like. Alkylidene is a subset of alkyl, referring to the same residues as alkyl, but having two points of attachment and specifically double bond unsaturation. The unsaturation present includes at least one double bond and a double bond can exist between the first carbon of the chain and a carbon atom of the rest of the molecule to which it is attached.
- [096] "Alkylidyne" refers to a straight or branched chain unsaturated divalent radical consisting solely of carbon and hydrogen atoms having from two to ten carbon atoms, e.g., propylid-2-ynyl, n-butylid-1-ynyl, and the like. Alkylidyne is a subset of alkyl, referring to the same residues as alkyl, but having two points of attachment and specifically triple bond unsaturation. The unsaturation present includes at least one triple bond and a triple bond can exist between the first carbon of the chain and a carbon atom of the rest of the molecule to which it is attached.
- [097] Any of the above radicals, "alkylene," "alkylidene" and "alkylidyne," when optionally substituted, may contain alkyl substitution which itself contains unsaturation. For example, 2-(2-phenylethynyl-but-3-enyl)-naphthalene (IUPAC name) contains an n-butylid-3-ynyl radical with a vinyl substituent at the 2-position of said radical.
- [098] "Alkoxy" refers to the group -O-alkyl, for example including carbon atoms of a straight, branched, cyclic configuration, unsaturated chains, and combinations thereof attached to the parent structure through an oxygen atom. Examples include methoxy, ethoxy, propoxy, isopropoxy, cyclopropyloxy, cyclohexyloxy and the like. Lower-alkoxy refers to groups containing one to eight carbons.
- [099] "Substituted alkoxy" refers to the group -O-(substituted alkyl), the substitution on the alkyl group generally containing more than only carbon (as defined by alkoxy). One

exemplary substituted alkoxy group is “polyalkoxy” or -O- (optionally substituted alkylene)-(optionally substituted alkoxy), and includes groups such as -OCH<sub>2</sub>CH<sub>2</sub>OCH<sub>3</sub>, and glycol ethers such as polyethyleneglycol and -O(CH<sub>2</sub>CH<sub>2</sub>O)<sub>x</sub>CH<sub>3</sub>, where x is an integer of between about 2 and about 20, in another example, between about 2 and about 10, and in a further example between about 2 and about 5. Another exemplary substituted alkoxy group is hydroxyalkoxy or -OCH<sub>2</sub>(CH<sub>2</sub>)<sub>y</sub>OH, where y is for example an integer of between about 1 and about 10, in another example y is an integer of between about 1 and about 4. Thus, where a group is defined as -OR, where “R” is optionally substituted alkyl, then such a group would include, but not be limited to, hydroxyalkoxy, polyalkoxy, and the like.

[0100] “Alkoxy” refers to an alkoxy as a linking group, for example -OCH<sub>2</sub>- and the like. Lower alkoxy then refers to groups containing one to eight carbons and an oxygen.

[0101] “Substituted alkoxy” refers to a linking group alkoxy, for example -OCH<sub>2</sub>CH<sub>2</sub>OCH<sub>2</sub>-. Optionally substituted alkoxy refers to both alkoxy and substituted alkoxy.

[0102] “Acyl” refers to groups of from one to ten carbon atoms of a straight, branched, cyclic configuration, saturated, unsaturated and aromatic and combinations thereof, attached to the parent structure through a carbonyl functionality. One or more carbons in the acyl residue may be replaced by nitrogen, oxygen or sulfur as long as the point of attachment to the parent remains at the carbonyl. Examples include acetyl, benzoyl, propionyl, isobutyryl, t-butoxycarbonyl, benzyloxycarbonyl and the like. Lower-acyl refers to groups containing one to eight carbons.

[0103] “α-Amino Acids” refer to naturally occurring and commercially available amino acids and optical isomers thereof. Typical natural and commercially available α-amino acids are glycine, alanine, serine, homoserine, threonine, valine, norvaline, leucine, isoleucine, norleucine, aspartic acid, glutamic acid, lysine, ornithine, histidine, arginine, cysteine, homocysteine, methionine, phenylalanine, homophenylalanine, phenylglycine, ortho-tyrosine, meta-tyrosine, para-tyrosine, tryptophan, glutamine, asparagine, proline and hydroxyproline. A “side chain of an α-amino acid” refers to the radical found on the α-carbon of an α-amino acid as defined above, for example, hydrogen (for glycine), methyl (for alanine), benzyl (for phenylalanine), and the like.

- [0104] "Amino" refers to the group -NH<sub>2</sub>. "Substituted amino," refers to the group -NHR or -NRR where each R is independently selected from the group: optionally substituted alkyl, optionally substituted alkoxy, optionally substituted aryl, optionally substituted heterocyclyl, acyl, carboxy, alkoxycarbonyl, sulfanyl, sulfinyl and sulfonyl, e.g., diethylamino, methylsulfonylamino, furanyl-oxy-sulfonamino.
- [0105] "Aryl" refers to aromatic 6- to 14-membered carbocyclic rings include, e.g., benzene, naphthalene, indane, tetralin, fluorene and the like.
- [0106] "Arylene" refers to an "aryl" that is a linker between two other groups. For example, for G-V-B, "phenylene" for V refers to a benzene ring system that links G and B, that is, G and B are each attached to different carbons of V, leaving four potential sites for further substitution on V.
- [0107] "Arylalkyl" refers to a residue in which an aryl moiety is attached to a parent structure via one of an alkylene, alkylidene, or alkylidyne radical. Examples include benzyl, phenethyl, phenylvinyl, phenylallyl and the like. The aryl, alkylene, alkylidene, or alkylidyne radical portion of an arylalkyl group may be optionally substituted. "Lower arylalkyl" refers to an arylalkyl where the "alkyl" portion of the group has one to eight carbons.
- [0108] "Halogen" or "halo" refers to fluorine, chlorine, bromine or iodine. Dihaloaryl, dihaloalkyl, trihaloaryl etc. refer to aryl and alkyl substituted with a plurality of halogens, but not necessarily a plurality of the same halogen; thus 4-chloro-3-fluorophenyl is within the scope of dihaloaryl.
- [0109] "Heteroatom" refers to O, S, N, or P.
- [0110] "Heterocyclyl" refers to a stable 3- to 15-membered ring radical that consists of carbon atoms and from one to five heteroatoms selected from the group consisting of nitrogen, phosphorus, oxygen and sulfur. For purposes of this invention, the heterocyclyl ring radical may be a monocyclic, bicyclic or tricyclic ring system, which may include fused or bridged ring systems, either aromatic, saturated, or combinations thereof; and the nitrogen, phosphorus, carbon or sulfur atoms in the heterocyclyl ring radical may be optionally oxidized to various oxidation states, for example for the purposes of this invention and to negate undo repetition in the description, the corresponding N-oxide of pyridine derivatives, and the like, are understood to be included as compounds of the invention. In addition, the nitrogen atom may be optionally quaternized; and the ring

radical may be partially or fully saturated or aromatic. Examples of such heterocyclyl ring radicals include, but are not limited to, azetidiny, acridiny, benzodioxoly, benzodioxany, benzofurany, carbazoy, cinnoliny, dioxolany, indoliziny, naphthyridiny, perhydroazepiny, phenaziny, phenothiaziny, phenoxaziny, phthalaziny, pteridiny, puriny, quinazoliny, quinoxaliny, quinoliny, isoquinoliny, tetrazoy, tetrahydroisoquinolyl, piperidiny, piperaziny, 2-oxopiperaziny, 2-oxopiperidiny, 2-oxopyrrolidiny, 2-oxoazepiny, azepiny, pyrroly, 4-piperidony, pyrrolidiny, pyrazoly, pyrazolidiny, imidazolyl, imidazoliny, imidazolidiny, dihydropyridiny, tetrahydropyridiny, pyridiny, pyraziny, pyrimidiny, pyridaziny, oxazolyl, oxazoliny, oxazolidiny, triazolyl, indany, isoxazolyl, isoxazolidiny, morpholiny, thiazolyl, thiazoliny, thiazolidiny, isothiazolyl, quinuclidiny, isothiazolidiny, indolyl, isoindolyl, indoliny, isoindoliny, octahydroindolyl, octahydroisoindolyl, quinolyl, isoquinolyl, decahydroisoquinolyl, benzimidazolyl, thiadiazolyl, benzopyrany, benzothiazolyl, benzoxazolyl, furyl, tetrahydrofuryl, tetrahydropyrany, thienyl, benzothielyl, thiamorpholiny, thiamorpholiny sulfoxide, thiamorpholiny sulfone, dioxaphospholany, and oxadiazolyl.

[0111] "Heteroalicyclic" refers specifically to a non-aromatic heterocyclyl ring system radical. Heteroalicyclic ring systems include saturated and partially bridged ring systems having geometries [4.4.0], [4.3.0], [4.2.0], [4.1.0], [3.3.0], [3.2.0], [3.1.0], [3.3.3], [3.3.2], [3.3.1], [3.2.2], [3.2.1], [2.2.2], [2.2.1], and the like.

[0112] "Heteroaryl" refers specifically to an aromatic heterocyclyl ring system radical.

[0113] "Heteroarylene" refers to a "heteroaryl" that is a linker between two other groups. For example, for M-P-L, "pyridylene" for P refers to a pyridine ring system that links M and L, that is, M and L are each attached to different atoms of P, leaving four potential sites for further substitution on P.

[0114] "Heterocyclylalkyl" refers to a residue in which a heterocyclyl ring is attached to a parent structure via one of an alkylene, alkylidene, or alkylidyne radical. Examples include (4-methylpiperazin-1-yl) methyl, (morpholin-4-yl) methyl, 2-(oxazolin-2-yl) ethyl, 4-(4-methylpiperazin-1-yl)-2-butenyl, and the like. The heterocyclyl, alkylene, alkylidene, or alkylidyne radical portion of an arylalkyl group may be optionally substituted. "Lower heterocyclylalkyl" refers to an arylalkyl where the "alkyl" portion of the group has one to eight carbons.

[0115] The term “imino” refers to a substitution on a carbon atom, more specifically to a doubly bonded nitrogen. For example, an imine, an amidine, and an oxime, all contain the “imino” group.

[0116] “Optional” or “optionally” means that the subsequently described event or circumstance may or may not occur, and that the description includes instances where said event or circumstance occurs and instances in which it does not. It will be understood by those skilled in the art with respect to any group containing one or more substituents that such groups are not intended to introduce any substitution or substitution patterns (e.g., substituted alkyl includes optionally substituted cycloalkyl groups, which in turn are defined as including optionally substituted alkyl groups, potentially *ad infinitum*) that are sterically impractical and/or synthetically non-feasible. “Optionally substituted” refers to all subsequent modifiers in a term, for example in the term “optionally substituted C<sub>1-8</sub>alkylaryl,” optional substitution may occur on both the “C<sub>1-8</sub>alkyl” portion and the “aryl” portion of the molecule; and for example, optionally substituted alkyl includes optionally substituted cycloalkyl groups, which in turn are defined as including optionally substituted alkyl groups, potentially *ad infinitum*. If a heterocyclic ring is “optionally substituted,” then both the carbon and any heteroatoms in the ring may be substituted thereon. Examples of optional substitution include, but are not limited to alkyl, halogen, alkoxy, hydroxy, oxo, carbamyl, acylamino, sulfonamido, carboxy, alkoxycarbonyl, acyl, alkylthio, alkylsulfonyl, nitro, cyano, amino, alkylamino, cycloalkyl and the like. Thus, for example, if a group “-C(O)R” is described, where “R” is optionally substituted alkyl, then “R” would include, but not be limited to, -CH<sub>2</sub>Ph, -CH<sub>2</sub>CH<sub>2</sub>OPh, -CH=CHPhCH<sub>3</sub>, -C<sub>3</sub>H<sub>4</sub>CH<sub>2</sub>N(H)Ph, and the like.

[0116] The term “ortho” is normally used in reference to relative position of two substituents on a benzene ring; however, in this application the term “ortho” is meant to apply to other aromatic ring systems where two substituents reside on adjacent carbons. For example, 3-bromo-4-fluoro-thiophene possesses a bromo group and a fluoro group which have an ortho, or 1,2-positional relationship, to each other.

[0117] The term “oxo” refers to a substitution on a carbon atom, more specifically to a doubly bonded oxygen. For example, an oxo-morpholine, a cyclohexanone, and an acyl group, all contain the “oxo” functionality.

[0118] “Saturated bridged ring system” refers to a bicyclic or polycyclic ring system that is not aromatic. Such a system may contain isolated or conjugated unsaturation, but not

aromatic or heteroaromatic rings in its core structure (but may have aromatic substitution thereon). For example, 2,3,3a,4,7,7a-hexahydro-1H-indene and 1,2,3,4,4a,5,8,8a-octahydro-naphthalene are included in the class "saturated bridged ring system."

[0119] "Substituted" alkyl, aryl, and heterocyclyl, refer respectively to alkyl, aryl, and heterocyclyl, wherein one or more (for example up to about 5, in another example, up to about 3) hydrogen atoms are replaced by a substituent independently selected from the group: optionally substituted alkyl (e.g., fluoroalkyl), optionally substituted alkoxy, alkylenedioxy (e.g. methylenedioxy), optionally substituted amino (e.g., alkylamino and dialkylamino), optionally substituted amidino, optionally substituted aryl (e.g., phenyl), optionally substituted arylalkyl (e.g., benzyl), optionally substituted aryloxy (e.g., phenoxy), optionally substituted arylalkyloxy (e.g., benzyloxy), carboxy (-COOH), carboalkoxy (i.e., acyloxy or -OOCR), carboxyalkyl (i.e., esters or -COOR), carboxamido, aminocarbonyl, benzyloxycarbonylamino (CBZ-amino), cyano, carbonyl, halogen, hydroxy, optionally substituted heterocyclylalkyl, optionally substituted heterocyclyl, nitro, sulfanyl, sulfinyl, sulfonyl, and thio.

[0120] "Sulfanyl" refers to the groups: -S-(optionally substituted alkyl), -S-(optionally substituted aryl), and -S-(optionally substituted heterocyclyl).

[0121] "Sulfinyl" refers to the groups: -S(O)-H, -S(O)-(optionally substituted alkyl), -S(O)-(optionally substituted aryl), and -S(O)-(optionally substituted heterocyclyl).

[0122] "Sulfonyl" refers to the groups: -S(O<sub>2</sub>)-H, -S(O<sub>2</sub>)-(optionally substituted alkyl), -S(O<sub>2</sub>)-(optionally substituted aryl), -S(O<sub>2</sub>)-(optionally substituted heterocyclyl), -S(O<sub>2</sub>)-(optionally substituted alkoxy), -S(O<sub>2</sub>)-(optionally substituted aryloxy), and -S(O<sub>2</sub>)-(optionally substituted heterocycliloxy).

[0123] The term "thiono" refers to a substitution on a carbon atom, more specifically to a doubly bonded sulfur. For example, a thioketone and a thioamide both contain the "thiono" functionality.

[0124] "Yield" for each of the reactions described herein is expressed as a percentage of the theoretical yield.

[0125] In some embodiments, as will be appreciated by those in the art, two adjacent groups on an aromatic system may be fused together to form a ring structure. The fused ring structure may contain heteroatoms and may be optionally substituted with one or

more groups. It should additionally be noted that saturated carbons of such fused groups (i.e. saturated ring structures) may contain two substitution groups.

[0126] Some of the compounds of the invention may have imino, amino, oxo or hydroxy substituents off aromatic heterocyclyl ring systems. For purposes of this disclosure, it is understood that such imino, amino, oxo or hydroxy substituents may exist in their corresponding tautomeric form, i.e., amino, imino, hydroxy or oxo, respectively. As well, tautomeric forms of ring conjugation, for example in a triazole, are understood to be within the scope of the invention, when formulae depict only one such tautomer.

[0127] Compounds of the invention are generally named using ACD/Name (available from Advanced Chemistry Development, Inc. of Toronto, Canada). This software derives names from chemical structures according to systematic application of the nomenclature rules agreed upon by the International Union of Pure and Applied Chemistry (IUPAC), International Union of Biochemistry and Molecular Biology (IUBMB), and the Chemical Abstracts Service (CAS).

[0128] The compounds of the invention, or their pharmaceutically acceptable salts, may have asymmetric carbon atoms, oxidized sulfur atoms or quaternized nitrogen atoms in their structure.

[0129] The compounds of the invention and their pharmaceutically acceptable salts may exist as single stereoisomers, racemates, and as mixtures of enantiomers and diastereomers. The compounds may also exist as geometric isomers. All such single stereoisomers, racemates and mixtures thereof, and geometric isomers are intended to be within the scope of this invention.

[0130] For linking groups, e.g.  $-OCH_2-$  or  $-C(=O)N(R)-$ , it is understood that either of the linking groups two partners may be bound to either end of the linking group. Put another way, linking groups are understood to describe both possible orientations between the partners that they link. Therefore for A-B-C, where B is  $-OCH_2-$ , both bonding schemes A- $OCH_2$ -B and A- $CH_2O$ -B are described. In the case of substituted linking groups, e.g. substituted alkoxyl, it is assumed that the substitution is in addition to the two groups to which the linking group is attached.

[0131] Methods for the preparation and/or separation and isolation of single stereoisomers from racemic mixtures or non-racemic mixtures of stereoisomers are well known in the art. For example, optically active (R)- and (S)- isomers may be prepared using chiral

synthons or chiral reagents, or resolved using conventional techniques. When desired, the R- and S-isomers may be resolved by methods known to those skilled in the art, for example by: formation of diastereoisomeric salts or complexes which may be separated, for example, by crystallization; via formation of diastereoisomeric derivatives which may be separated, for example, by crystallization, gas-liquid or liquid chromatography; selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic oxidation or reduction, followed by separation of the modified and unmodified enantiomers; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support, such as silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where a desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step may be required to liberate the desired enantiomeric form. Alternatively, specific enantiomer may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents, or by converting one enantiomer to the other by asymmetric transformation. For a mixture of enantiomers, enriched in a particular enantiomer, the major component enantiomer may be further enriched (with concomitant loss in yield) by recrystallization.

[0132] The symbol “-” means a single bond, “=” means a double bond, “≡” means a triple bond, and “” refers to a group on a double-bond as occupying either position on the terminus of a double bond to which the symbol is attached. When a group is depicted removed from its parent formula, the “” symbol will be used at the end of the bond which was theoretically cleaved in order to separate the group from its parent structural formula.

[0133] When a group “R” is depicted as existing on a ring system, as for example in the

formula , then a substituent “R” may reside on any atom of the ring system, assuming replacement of a depicted, implied, or expressly defined hydrogen from one of the ring atoms, so long as a stable structure is formed.

[0134] When a group “R” is depicted as existing on a fused ring system, as for example in

the formula , then a substituent “R” may reside on any atom of the fused ring system, assuming replacement of a depicted (e.g. the -NH- in the formula above),

implied (e.g. as in the formula above, where the hydrogens are not shown but understood to be present), or expressly defined hydrogen (e.g. where in the formula above, "X" equals =CH-) from one of the ring atoms, so long as a stable structure is formed. In the example depicted, the "R" group may reside on either the 5-membered or the 6-membered ring of the fused ring system. In the formula depicted above, when y is 2 for example, then the two "R's" may reside on any two atoms of the ring system, again assuming each replaces a depicted, implied, or expressly defined hydrogen on the ring. When there are more than one such depicted "floating" groups, as for example in the

formula, where there are two groups, namely, the "R" and the bond indicating attachment to a parent structure. In such cases, the "floating" groups may reside on any atoms of the ring system, again assuming each floating group replaces a depicted, implied, or expressly defined unique hydrogen on the ring.

[0135] "Substituted cycloalkyl," in this application, is meant to include bridged or fused ring systems wherein an all-carbon bridge portion of such ring systems, along with the two bridgehead carbons, is considered as a cycloalkyl. For example, the formula

depicts a bridged ring system that has "R" substitution and is itself a substituent of a parent compound (as denoted by the "∼" symbol, *supra*). As mentioned above, either of the depicted "floating" groups may reside on either the alkyl bridge or the aromatic ring of the depicted bridged ring system. In this application, for such ring systems, when the parent compound is bonded to the alkyl bridge, as in

[0136] When a group "R" is depicted as existing on a saturated ring system, as for

example in the formula (R)<sub>y</sub>, where "y" can be more than one, assuming each replaces a currently depicted, implied, or expressly defined hydrogen on the ring, then where the resulting structure is stable, two "R's" may reside on the same carbon. A simple example is when R is a methyl group, then in this instance there would exist a geminal dimethyl on a carbon of the depicted ring. In another example, two R's on the same carbon, including that carbon, may form a ring, thus creating a spirocyclic ring structure with the depicted ring.

[0137] "Patient" for the purposes of the present invention includes humans and other animals, particularly mammals, and other organisms. Thus the methods are applicable to both human therapy and veterinary applications. In a preferred embodiment the patient is a mammal, and in a most preferred embodiment the patient is human.

[0138] "Kinase-dependent diseases or conditions" refer to pathologic conditions that depend on the activity of one or more protein kinases. Kinases either directly or indirectly participate in the signal transduction pathways of a variety of cellular activities including proliferation, adhesion, migration, differentiation and invasion.

[0139] While not wishing to be bound to theory, phosphatases can also play a role in "kinase-dependent diseases or conditions" as cognates of kinases. That is, kinases phosphorylate and phosphatases dephosphorylate, for example protein substrates. Therefore compounds of the invention, while modulating kinase activity as described herein, may also modulate, either directly or indirectly, phosphatase activity. This additional modulation, if present, may be synergistic (or not) to activity of compounds of the invention toward a related or otherwise interdependent kinase or kinase family. Thus, "kinase-dependent diseases or conditions" are those diseases that should be mitigated via treatment of a patient with compounds and/or formulations of the invention. Kinase-dependent diseases or conditions include diseases or disorders associated with uncontrolled, abnormal and/or unwanted cellular activities such as those set forth in paragraphs [0031]-[0038].

[0140] "Therapeutically effective amount" is an amount of a compound of the invention, that when administered to a patient, ameliorates a symptom of the disease. The amount of a compound of the invention which constitutes a "therapeutically effective amount" will vary depending on the compound, the disease state and its severity, the age of the patient to be treated, and the like. The therapeutically effective amount can be determined routinely by one of ordinary skill in the art having regard to his own knowledge and to this disclosure.

[0141] "Cancer" refers to cellular-proliferative disease states, including but not limited to: Cardiac: sarcoma (angiosarcoma, fibrosarcoma, rhabdomyosarcoma, liposarcoma), myxoma, rhabdomyoma, fibroma, lipoma and teratoma; Lung: bronchogenic carcinoma (squamous cell, undifferentiated small cell, undifferentiated large cell, adenocarcinoma), alveolar (bronchiolar) carcinoma, bronchial adenoma, sarcoma, lymphoma, chondromatous hamartoma, mesothelioma; Gastrointestinal: esophagus (squamous cell

[0142] “Pharmaceutically acceptable acid addition salt” refers to those salts that retain the biological effectiveness of the free bases and that are not biologically or otherwise undesirable, formed with inorganic acids such as hydrochloric acid, hydrobromic acid, sulfuric acid, nitric acid, phosphoric acid, and the like, as well as organic acids such as acetic acid, trifluoroacetic acid, propionic acid, glycolic acid, pyruvic acid, oxalic acid, maleic acid, malonic acid, succinic acid, fumaric acid, tartaric acid, citric acid, benzoic acid, cinnamic acid, mandelic acid, methanesulfonic acid, ethanesulfonic acid, p-toluenesulfonic acid, salicylic acid and the like.

[0143] “Pharmaceutically acceptable base addition salts” include those derived from inorganic bases such as sodium, potassium, lithium, ammonium, calcium, magnesium, iron, zinc, copper, manganese, aluminum salts and the like. Exemplary salts are the ammonium, potassium, sodium, calcium, and magnesium salts. Salts derived from pharmaceutically acceptable organic non-toxic bases include, but are not limited to, salts of primary, secondary, and tertiary amines, substituted amines including naturally occurring substituted amines, cyclic amines and basic ion exchange resins, such as isopropylamine, trimethylamine, diethylamine, triethylamine, tripropylamine, ethanolamine, 2-dimethylaminoethanol, 2-diethylaminoethanol, dicyclohexylamine, lysine, arginine, histidine, caffeine, procaine, hydrabamine, choline, betaine, ethylenediamine, glucosamine, methylglucamine, theobromine, purines, piperazine, piperidine, N-ethylpiperidine, polyamine resins, and the like. Exemplary organic bases are isopropylamine, diethylamine, ethanolamine, trimethylamine, dicyclohexylamine, choline, and caffeine. (See, for example, S. M. Berge, et al., “Pharmaceutical Salts,” J. Pharm. Sci., 1977;66:1-19 which is incorporated herein by reference.)

[0144] “Prodrug” refers to compounds that are transformed (typically rapidly) *in vivo* to yield the parent compound of the above formulae, for example, by hydrolysis in blood. Common examples include, but are not limited to, ester and amide forms of a compound having an active form bearing a carboxylic acid moiety. Examples of pharmaceutically acceptable esters of the compounds of this invention include, but are not limited to, alkyl esters (for example with between about 1 and about 6 carbons) wherein the alkyl group is a straight or branched chain. Acceptable esters also include cycloalkyl esters and arylalkyl esters such as, but not limited to benzyl. Examples of pharmaceutically

acceptable amides of the compounds of this invention include, but are not limited to, primary amides, and secondary and tertiary alkyl amides (for example with between about 1 and about 6 carbons). Amides and esters of the compounds of the present invention may be prepared according to conventional methods. Another example of a prodrug is a pyridine group; in many cases the pyridine group is oxidized to its corresponding N-oxide that may be a biologically active compound of the invention. Thus the "pyridine form" may be thought of as a prodrug. A thorough discussion of prodrugs is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference.

[0145] "Metabolite" refers to the break-down or end product of a compound or its salt produced by metabolism or biotransformation in the animal or human body; e.g., biotransformation to a more polar molecule such as by oxidation, reduction, or hydrolysis, or to a conjugate (see Goodman and Gilman, "The Pharmacological Basis of Therapeutics" 8<sup>sup</sup>.th Ed., Pergamon Press, Gilman et al. (eds), 1990 for a discussion of biotransformation). As used herein, the metabolite of a compound of the invention or its salt may be the biologically active form of the compound in the body. In one example, a prodrug may be used such that the biologically active form, a metabolite, is released *in vivo*. In another example, a biologically active metabolite is discovered serendipitously, that is, no prodrug design *per se* was undertaken. An assay for activity of a metabolite of a compound of the present invention is known to one of skill in the art in light of the present disclosure.

[0146] In addition, the compounds of the present invention can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the present invention.

[0147] In addition, it is intended that the present invention cover compounds made either using standard organic synthetic techniques, including combinatorial chemistry or by biological methods, such as bacterial digestion, metabolism, enzymatic conversion, and the like.

[0148] "Treating" or "treatment" as used herein covers the treatment of a disease-state in a human, which disease-state is characterized by uncontrolled, abnormal or unwanted

cellular proliferation, differentiation, programmed cell death migration or chemoinvasion and invasion and includes at least one of: (i) preventing the disease-state from occurring in a human, in particular, when such human is predisposed to the disease-state but has not yet been diagnosed as having it; (ii) inhibiting the disease-state, i.e., arresting its development; and (iii) relieving the disease-state, i.e., causing regression of the disease-state. As is known in the art, adjustments for systemic versus localized delivery, age, body weight, general health, sex, diet, time of administration, drug interaction and the severity of the condition may be necessary, and will be ascertainable with routine experimentation by those skilled in the art.

### **General Administration**

[0149] Administration of the compounds of the invention, or their pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical composition, can be carried out via any of the accepted modes of administration or agents for serving similar utilities. Thus, administration can be, for example, orally, nasally, parenterally (intravenous, intramuscular, or subcutaneous), topically, transdermally, intravaginally, intravesically, intracisternally, or rectally, in the form of solid, semi-solid, lyophilized powder, or liquid dosage forms, such as for example, tablets, suppositories, pills, soft elastic and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, preferably in unit dosage forms suitable for simple administration of precise dosages.

[0150] The compositions will include a conventional pharmaceutical carrier or excipient and a compound of the invention as the/an active agent, and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, adjuvants, etc. Compositions of the invention may be used in combination with anticancer or other agents that are generally administered to a patient being treated for cancer. Adjuvants include preserving, wetting, suspending, sweetening, flavoring, perfuming, emulsifying, and dispensing agents. Prevention of the action of microorganisms can be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example sugars, sodium chloride, and the like. Prolonged absorption of the injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

[0151] If desired, a pharmaceutical composition of the invention may also contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, antioxidants, and the like, such as, for example, citric acid, sorbitan monolaurate, triethanolamine oleate, butylated hydroxytoluene, etc.

[0152] Compositions suitable for parenteral injection may comprise physiologically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyols (propyleneglycol, polyethyleneglycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

[0153] One preferable route of administration is oral, using a convenient daily dosage regimen that can be adjusted according to the degree of severity of the disease-state to be treated.

[0154] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is admixed with at least one inert customary excipient (or carrier) such as sodium citrate or dicalcium phosphate or (a) fillers or extenders, as for example, starches, lactose, sucrose, glucose, mannitol, and silicic acid, (b) binders, as for example, cellulose derivatives, starch, alginates, gelatin, polyvinylpyrrolidone, sucrose, and gum acacia, (c) humectants, as for example, glycerol, (d) disintegrating agents, as for example, agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, croscarmellose sodium, complex silicates, and sodium carbonate, (e) solution retarders, as for example paraffin, (f) absorption accelerators, as for example, quaternary ammonium compounds, (g) wetting agents, as for example, cetyl alcohol, and glycerol monostearate, magnesium stearate and the like (h) adsorbents, as for example, kaolin and bentonite, and (i) lubricants, as for example, talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, or mixtures thereof. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents.

[0155] Solid dosage forms as described above can be prepared with coatings and shells, such as enteric coatings and others well known in the art. They may contain pacifying

agents, and can also be of such composition that they release the active compound or compounds in a certain part of the intestinal tract in a delayed manner. Examples of embedded compositions that can be used are polymeric substances and waxes. The active compounds can also be in microencapsulated form, if appropriate, with one or more of the above-mentioned excipients.

[0156] Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs. Such dosage forms are prepared, for example, by dissolving, dispersing, etc., a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, glycerol, ethanol and the like; solubilizing agents and emulsifiers, as for example, ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propyleneglycol, 1,3-butyleneglycol, dimethylformamide; oils, in particular, cottonseed oil, groundnut oil, corn germ oil, olive oil, castor oil and sesame oil, glycerol, tetrahydrofurfuryl alcohol, polyethyleneglycols and fatty acid esters of sorbitan; or mixtures of these substances, and the like, to thereby form a solution or suspension.

[0157] Suspensions, in addition to the active compounds, may contain suspending agents, as for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar and tragacanth, or mixtures of these substances, and the like.

[0158] Compositions for rectal administrations are, for example, suppositories that can be prepared by mixing the compounds of the present invention with for example suitable non-irritating excipients or carriers such as cocoa butter, polyethyleneglycol or a suppository wax, which are solid at ordinary temperatures but liquid at body temperature and therefore, melt while in a suitable body cavity and release the active component therein.

[0159] Dosage forms for topical administration of a compound of this invention include ointments, powders, sprays, and inhalants. The active component is admixed under sterile conditions with a physiologically acceptable carrier and any preservatives, buffers, or propellants as may be required. Ophthalmic formulations, eye ointments, powders, and solutions are also contemplated as being within the scope of this invention.

[0160] Generally, depending on the intended mode of administration, the pharmaceutically acceptable compositions will contain about 1% to about 99% by weight of a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, and 99% to 1% by weight of a suitable pharmaceutical excipient. In one example, the composition will be between about 5% and about 75% by weight of a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, with the rest being suitable pharmaceutical excipients.

[0161] Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington's Pharmaceutical Sciences, 18th Ed., (Mack Publishing Company, Easton, Pa., 1990). The composition to be administered will, in any event, contain a therapeutically effective amount of a compound of the invention, or a pharmaceutically acceptable salt thereof, for treatment of a disease-state in accordance with the teachings of this invention.

[0162] The compounds of the invention, or their pharmaceutically acceptable salts, are administered in a therapeutically effective amount which will vary depending upon a variety of factors including the activity of the specific compound employed, the metabolic stability and length of action of the compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular disease-states, and the host undergoing therapy. The compounds of the present invention can be administered to a patient at dosage levels in the range of about 0.1 to about 1,000 mg per day. For a normal human adult having a body weight of about 70 kilograms, a dosage in the range of about 0.01 to about 100 mg per kilogram of body weight per day is an example. The specific dosage used, however, can vary. For example, the dosage can depend on a number of factors including the requirements of the patient, the severity of the condition being treated, and the pharmacological activity of the compound being used. The determination of optimum dosages for a particular patient is well known to those skilled in the art.

#### **Utility of compounds of the invention as screening agents**

[0163] To employ the compounds of the invention in a method of screening for candidate agents that bind to, for example a Chk1 receptor kinase, the protein is bound to a support, and a compound of the invention is added to the assay. Alternatively, the compound of

the invention is bound to the support and the protein is added. Classes of candidate agents among which novel binding agents may be sought include specific antibodies, non-natural binding agents identified in screens of chemical libraries, peptide analogs, etc. Of particular interest are screening assays for candidate agents that have a low toxicity for human cells. A wide variety of assays may be used for this purpose, including labeled *in vitro* protein-protein binding assays, electrophoretic mobility shift assays, immunoassays for protein binding, functional assays (phosphorylation assays, etc.) and the like.

[0164] The determination of the binding of the candidate agent to, for example, a Chk1 protein may be done in a number of ways. In one example, the candidate agent (the compound of the invention) is labeled, for example, with a fluorescent or radioactive moiety and binding determined directly. For example, this may be done by attaching all or a portion of the Chk1 protein to a solid support, adding a labeled agent (for example a compound of the invention in which at least one atom has been replaced by a detectable isotope), washing off excess reagent, and determining whether the amount of the label is that present on the solid support. Various blocking and washing steps may be utilized as is known in the art.

[0165] By "labeled" herein is meant that the compound is either directly or indirectly labeled with a label which provides a detectable signal, e.g., radioisotope, fluorescent tag, enzyme, antibodies, particles such as magnetic particles, chemiluminescent tag, or specific binding molecules, etc. Specific binding molecules include pairs, such as biotin and streptavidin, digoxin and antidigoxin etc. For the specific binding members, the complementary member would normally be labeled with a molecule which provides for detection, in accordance with known procedures, as outlined above. The label can directly or indirectly provide a detectable signal.

[0166] In some embodiments, only one of the components is labeled. For example, a Chk1 protein may be labeled at tyrosine positions using  $^{125}\text{I}$ , or with fluorophores. Alternatively, more than one component may be labeled with different labels; using  $^{125}\text{I}$  for the proteins, for example, and a fluorophor for the candidate agents.

[0167] The compounds of the invention may also be used as competitors to screen for additional drug candidates. "Candidate bioactive agent" or "drug candidate" or grammatical equivalents as used herein describe any molecule, e.g., protein, oligopeptide, small organic molecule, polysaccharide, polynucleotide, etc., to be tested for bioactivity.

They may be capable of directly or indirectly altering the cellular proliferation phenotype or the expression of a cellular proliferation sequence, including both nucleic acid sequences and protein sequences. In other cases, alteration of cellular proliferation protein binding and/or activity is screened. In the case where protein binding or activity is screened, some embodiments exclude molecules already known to bind to that particular protein. Exemplary embodiments of assays described herein include candidate agents, which do not bind the target protein in its endogenous native state, termed herein as "exogenous" agents. In one example, exogenous agents further exclude antibodies to Chk1.

[0168] Candidate agents can encompass numerous chemical classes, though typically they are organic molecules having a molecular weight of more than about 100 and less than about 2,500 daltons. Candidate agents comprise functional groups necessary for structural interaction with proteins, particularly hydrogen bonding and lipophilic binding, and typically include at least an amine, carbonyl, hydroxyl, ether, or carboxyl group, for example at least two of the functional chemical groups. The candidate agents often comprise cyclical carbon or heterocyclyl structures and/or aromatic or polyaromatic structures substituted with one or more of the above functional groups. Candidate agents are also found among biomolecules including peptides, saccharides, fatty acids, steroids, purines, pyrimidines, derivatives, structural analogs, or combinations thereof.

[0169] Candidate agents are obtained from a wide variety of sources including libraries of synthetic or natural compounds. For example, numerous means are available for random and directed synthesis of a wide variety of organic compounds and biomolecules, including expression of randomized oligonucleotides. Alternatively, libraries of natural compounds in the form of bacterial, fungal, plant and animal extracts are available or readily produced. Additionally, natural or synthetically produced libraries and compounds are readily modified through conventional chemical, physical and biochemical means. Known pharmacological agents may be subjected to directed or random chemical modifications, such as acylation, alkylation, esterification, amidification to produce structural analogs.

[0170] In one example, the binding of the candidate agent is determined through the use of competitive binding assays. In this example, the competitor is a binding moiety known to bind to Chk1, such as an antibody, peptide, binding partner, ligand, etc. Under certain

circumstances, there may be competitive binding as between the candidate agent and the binding moiety, with the binding moiety displacing the candidate agent.

[0171] In some embodiments, the candidate agent is labeled. Either the candidate agent, or the competitor, or both, is added first to Chk1 for a time sufficient to allow binding, if present. Incubations may be performed at any temperature that facilitates optimal activity, typically between 4°C and 40°C.

[0172] Incubation periods are selected for optimum activity, but may also be optimized to facilitate rapid high throughput screening. Typically between 0.1 and 1 hour will be sufficient. Excess reagent is generally removed or washed away. The second component is then added, and the presence or absence of the labeled component is followed, to indicate binding.

[0173] In one example, the competitor is added first, followed by the candidate agent. Displacement of the competitor is an indication the candidate agent is binding to Chk1 and thus is capable of binding to, and potentially modulating, the activity of the Chk1. In this embodiment, either component can be labeled. Thus, for example, if the competitor is labeled, the presence of label in the wash solution indicates displacement by the agent. Alternatively, if the candidate agent is labeled, the presence of the label on the support indicates displacement.

[0174] In an alternative embodiment, the candidate agent is added first, with incubation and washing, followed by the competitor. The absence of binding by the competitor may indicate the candidate agent is bound to Chk1 with a higher affinity. Thus, if the candidate agent is labeled, the presence of the label on the support, coupled with a lack of competitor binding, may indicate the candidate agent is capable of binding to Chk1.

[0175] It may be of value to identify the binding site of Chk1. This can be done in a variety of ways. In one embodiment, once Chk1 has been identified as binding to the candidate agent, the Chk1 is fragmented or modified and the assays repeated to identify the necessary components for binding.

[0176] Modulation is tested by screening for candidate agents capable of modulating the activity of Chk1 comprising the steps of combining a candidate agent with Chk1, as above, and determining an alteration in the biological activity of the Chk1. Thus, in this embodiment, the candidate agent should both bind to (although this may not be necessary), and alter its biological or biochemical activity as defined herein. The

methods include both *in vitro* screening methods and *in vivo* screening of cells for alterations in cell viability, morphology, and the like.

[0177] Alternatively, differential screening may be used to identify drug candidates that bind to native Chk1, but cannot bind to modified Chk1.

[0178] Positive controls and negative controls may be used in the assays. For example, all control and test samples are performed in at least triplicate to obtain statistically significant results. Incubation of samples is for a time sufficient for the binding of the agent to the protein. Following incubation, samples are washed free of non-specifically bound material and the amount of bound, generally labeled agent determined. For example, where a radiolabel is employed, the samples may be counted in a scintillation counter to determine the amount of bound compound.

[0179] A variety of other reagents may be included in the screening assays. These include reagents like salts, neutral proteins, e.g., albumin, detergents, etc which may be used to facilitate optimal protein-protein binding and/or reduce non-specific or background interactions. Also reagents that otherwise improve the efficiency of the assay, such as protease inhibitors, nuclease inhibitors, anti-microbial agents, etc., may be used. The mixture of components may be added in any order that provides for the requisite binding.

## Synthesis of Compounds

- [0181] Scheme 1 depicts general synthetic routes for compounds of the invention and is not intended to be limiting. Specific examples are described subsequently to these general synthetic descriptions. In the generalizations below, specific reaction conditions, for example, reagents such as added bases, acids, solvents, temperature, and the like are not described so as not to confuse the discussion.
- [0182] The general routes, in conjunction with the specific examples, contain sufficient information to allow one skilled in the art to synthesize compounds of the invention. In Scheme 1, some substituents are not defined described as taking part in the synthesis of compounds of the invention. This is done purely for simplification of description of syntheses. Such substituents in formula I may be appended to the scaffold of formula I at any time during synthesis or may pre-exist on intermediates or starting materials used to make compounds of the invention, as would be understood by one skilled in the art. More specific examples are presented below to more fully describe the invention.
- [0183] Scheme 1 depicts examples of how compounds of the invention, consistent with formula I, are made (in these examples for simplicity of discussion, substituents  $R^1$ ,  $R^2$ , and  $R^3$  are -H, but this is not always the case). Generally, but not necessarily, a starting material will take the form of, for example, (i) or (ii). For example, (i) may take the form of a commercially available 3-amino-pyrazine (where Z is N). The group "F<sub>1</sub>" represents functionality that can be converted to, or functionality that exists in, compounds of formula I. For example if F<sub>1</sub> represents a carboxylic acid group, then where A, of formula I, is a carbonyl, then (ii) may more appropriately represent the starting material. In other cases, A is introduced into (i) to make (ii). For example, if F<sub>1</sub> is a cyano group, then in some instances the cyano group in (i) is converted to a triazole ring system to produce A in (ii).
- [0184] F<sub>2</sub> represents a functionality that is ultimately converted to, or used in the production or introduction of, E of formula I. For example, if F<sub>1</sub> is a carboxylic acid, then -A-F<sub>2</sub> can represent the esterified form of the carboxylic acid. If F<sub>1</sub> is a cyano group, then -A-F<sub>2</sub> can represent, for example, a triazole ring with appended functionality for subsequent transformation. Although not depicted, the functionality -A-E may exist in commercially available starting materials, or be introduced in a single step to (i).

[0185]  $F_3$  represents a functionality that is ultimately converted to, or used in the production or introduction of, W of formula I. For example, intermediate (ii) is brominated selectively to afford (iii) where  $F_3$  is -Br. Using aryl-aryl coupling reactions known to one skilled in the art, W is introduced, preferably with functionality  $F_4$ , into (iii) to make intermediate (v).  $F_4$  represents a functionality that is ultimately converted to, or used in the production or introduction of, X of formula I. Alternatively, (iii) is converted to (iv) via introduction of E (for example an ester represented by -A- $F_2$  is converted to an amide represented by -A-E). Scheme 1 depicts only a subset of possible variations of making compounds of the invention.

Scheme 1

[0186] Still referring to Scheme 1, intermediate (v) can be converted to intermediate (vi) via introduction of E (intermediate (vi) can also be made from (iv) via introduction of -W- $F_4$ ). Also from intermediate (v), X is introduced, preferably with functionality  $F_5$ , to make intermediate (vii).  $F_5$  represents a functionality that is ultimately converted to, or used in the production or introduction of, Y of formula I. In many examples, -X- $F_5$  represents a linking group X with a reactive functionality,  $F_5$ , that is used to attach Y to X. In such cases, (vii) is converted to (ix). Alternatively, intermediate (vii) is converted,

via introduction of  $-X-F_5$ , into (viii). Compounds of formula (x) are made from either intermediate (ix) or (viii). Compounds (x) are consistent with, and a subset of, formula I of the invention.

[0187] Thus compounds of the invention are generally made as depicted in Scheme 1. One skilled in the art would recognize that many variations of synthetic routes not included in Scheme 1 are possible, and thus are within the scope of the invention.

[0188] Scheme 2 depicts a general method of making 3-amino-pyrazine-2-carboxamides of the invention. Commercially available methyl 3-amino-pyrazine-2-carboxylate was brominated using the procedure of Russ, T., Ried, W., Ullrich, F., and Mutschler, E. *Arch. Pharm. (Weinheim)* 1992, 325, 761–767 (by analogy, bromination of commercially available 2-aminonicotinic acid (for example as described in United States Patents 3,950,160, and 4,361,700) affords 2-amino-5-bromopyridine-3-carboxylic acid. This intermediate can be used to make corresponding amino-pyridine analogues using similar methods similar to those described in Schemes 1 – 4 for 3-amino-pyrazine compounds.) The resulting bromo ester, (xi), was utilized, for example, in a Suzuki coupling with arylboronic acids by the method of W. J. Thompson, J. H. Jones, P. A. Lyle, and J. E. Thies *J. Org. Chem.* 1988, 53, 2052 – 2055 or a similar procedure. The resulting aryl substituted pyrazine ester, (xiv), was then hydrolyzed to the corresponding acid (xv). Acid (xv) was coupled with primary and secondary amines to give amides, (xvi), followed by removal of any protecting groups if necessary. Alternatively, aryl substituted pyrazine ester (xiv) was reacted directly with ammonia, methylamine, or other amines in a suitable solvent at elevated temperatures to afford amides (xvi). Again alternatively, bromopyrazine ester (xi) was converted (typically via hydrolysis) to bromopyrazine acid (xii), which was then coupled with amines to afford amides (xiii). The resulting bromopyrazine amides (xiii) were then, for example, coupled with arylboronic acids under Suzuki conditions to afford amides (xvi). In amides (xvi), the group  $-NR_aR_b$  represents -E of formula I.

[0189] Alternatively, the ester moiety for example in intermediates (xi) and (xiv) were converted to an acid, amide, nitrile, aldehyde, hydroxymethyl, or other functional groups. These functional groups were then be elaborated into oximes, imines, hydrazones, or heterocycles such as triazoles, pyrimidines, oxadiazoles, and other heterocycles in accordance with group -A-E of formula I. More detailed descriptions of exemplary transformations are described below.

Scheme 2

[0190] Typically, but not necessarily, the aryl groups (denoted Ar in Scheme 2, corresponding to W in formula I) contained functional groups such as an ester, aldehyde, hydroxymethyl, amine, hydroxyl, or other groups that were modified or functionalized either before or after the the aryl groups were coupled to, for example the bromo pyrazine. Schemes 3 and 4 depict a number of typical transformations that were carried out to form group -X-Y onto W, in cases where W was a meta-phenylene. These are presented as examples and are not intended to limit the scope of the invention.

[0191] Referring to Scheme 3, benzylic amine intermediate (xix) was formed, for example, either from benzylic alcohol intermediate (xvii) or aryl aldehyde intermediate (xviii) using standard synthetic techniques. For example, the -OH group of (xvii) was transformed into a leaving group and subsequently displaced with ammonia or an ammonia equivalent (such as a phthalimide) to form (xix). Alternatively, aldehyde (xviii) is subjected to reductive amination conditions to form (xix). Intermediate (xix) was acylated, for example with acid chlorides, to form (xx) (according to formula I, W is meta-phenylene and X is -C(=O)NHCH<sub>2</sub>-). Intermediate (xix) in many cases was, or otherwise could be, also reacted with sulfonyl chlorides, isocyanates, and other electrophiles. In another example, intermediate (xix) was subjected to reductive amination conditions to provide compounds (xxi).

Scheme 3

[0192] Scheme 4 shows additional transformations that were carried out to form group -X-Y onto W, in cases where W was a meta-phenylene. For example: esters (xxii) were converted to amides (xxiii), phenols (xxiv) were converted to ethers (xxv), and anilines (xxvi) were converted to amides (xxvii).

### Examples

[0193] The following examples serve to more fully describe the manner of using the above-described invention, as well as to set forth the best modes contemplated for

carrying out various aspects of the invention. It is understood that these examples in no way serve to limit the true scope of this invention, but rather are presented for illustrative purposes. ### Example 1

#### 3-amino-6-phenyl-N-(phenylmethyl)pyrazine-2-carboxamide

[0194] Methyl 3-amino-6-bromo-pyrazine-2-carboxylate: Commercially available methyl 3-amino-pyrazine-2-carboxylate (available from Aldrich Chemical Company) was brominated using a procedure similar to that of Russ, T., Ried, W., Ullrich, F., and Mutschler, E. *Arch. Pharm. (Weinheim)* 1992, 325, 761 – 767. To a solution of methyl 3-amino-2-pyrazine carboxylate (30.0 g, 200 mmol) in acetic acid (200 mL), bromine (11 mL) was added slowly via addition funnel. After complete addition of bromine, sodium carbonate powder was added slowly until precipitation occurred. The reaction mixture was allowed to stir at room temperature for 2 h. The reaction mixture was reduced to half-volume in vacuo and then diluted with water (500 mL). The reaction mixture was shaken vigorously and the resulting solid was collected using vacuum filtration. The solid was washed with ether to afford a pure yellow solid (91 % yield).

[0195] Methyl 3-amino-6-phenylpyrazine-2-carboxylate: Methyl 3-amino-6-phenylpyrazine-2-carboxylate was prepared from methyl 3-amino-6-bromo-pyrazine-2-carboxylate using the procedure similar to that of W. J. Thompson, J. H. Jones, P. A. Lyle, and J. E. Thies *J. Org. Chem.* 1988, 53, 2052 – 2055.

[0196] 3-amino-6-phenylpyrazine-2-carboxylic acid: To a solution of methyl 3-amino-6-phenylpyrazine-2-carboxylate (1.2 g, 5.26 mmol) in methanol (5 mL) was added 6.0 N aqueous sodium hydroxide (6 mL) at room temperature. The solution was stirred at 50 °C for 3 h. The reaction was neutralized slowly by adding 2.0 N hydrochloric acid until the pH of the solution became in the 2-3 range at 0° C. The solution was extracted with ethyl acetate (50 mL). The organic layer was washed with saturated aqueous sodium chloride (50 mL) and dried over magnesium sulfate. Filtration and concentration at reduced pressure afforded 3-amino-6-phenylpyrazine-2-carboxylic acid (0.59 g, 52% yield): MS (EI) for C<sub>11</sub>H<sub>9</sub>O<sub>2</sub>: 216 (MH<sup>+</sup>)

The reaction was stirred for 15 min before benzylamine (0.56 mmol) was added. The reaction mixture was allowed to stir overnight. The reaction was diluted with ethyl acetate (200 mL) and washed with water (50 mL), saturated aqueous sodium bicarbonate (40 mL), 2.0 N aqueous hydrochloric acid (30 mL), and saturated aqueous sodium chloride (25 mL). ## Example 2

### 3-Amino-6-naphthalen-1-ylpyrazine-2-carboxamide

- [0210] Methyl 3-amino-6-naphthalen-1-ylpyrazine-2-carboxylate: To a solution of methyl 3-amino-6-bromopyrazine-2-carboxylate (0.18 g, 0.74 mmol) in N,N-dimethylformamide (10 mL) were added [1,1'-bis (diphenylphosphino)ferrocene]dichloropalladium(II) complex with dichloromethane (1:1, 60 mg, 0.07 mmol), 1-naphthylboronic acid (0.32 g, 1.89 mmol), and triethylamine (0.15g, 1.52 mmol). The solution was degassed with nitrogen for 3-5 min. The reaction was then heated to 85-90° C overnight. The reaction was cooled to room temperature and diluted with ethyl acetate (300 mL). The crude

solution was passed through a pad of silica gel under vacuum. The filtrate was washed with saturated aqueous sodium bicarbonate (50 mL) and saturated aqueous sodium chloride (50 mL). The organic layer was dried over magnesium sulfate, filtered and concentrated at reduced pressure to afford impure product. Column purification on silica (8:2 hexanes/ ethyl acetate) afforded methyl 3-amino-6-naphthalen-1-ylpyrazine-2-carboxylate (80 mg, 39% yield) as yellow solid:  $^1\text{H}$  NMR (400 MHz,  $\text{CDCl}_3$ ):  $\delta$  8.52 (br s, 1H), 8.12 (br s, 1H), 7.92 (m, 2H), 7.52 (m, 5H), 4.02 (s, 3H); MS (EI) for  $\text{C}_{16}\text{H}_{13}\text{N}_3\text{O}_2$ : 280 ( $\text{MH}^+$ ).

[0211] 3-amino-6-naphthalen-1-ylpyrazine-2-carboxamide: A solution of methyl 3-amino-6-naphthalen-1-ylpyrazine-2-carboxylate (80 mg, 0.29 mmol) in methanol (30 mL) was saturated with ammonia gas at  $0^\circ\text{C}$  in a high-pressure test tube. The reaction tube was tightly sealed and heated to  $80\text{--}90^\circ\text{C}$  for 4h. The suspension was cooled to  $0^\circ\text{C}$  and  $\text{NH}_3$  (g) was bubbled until saturation was achieved. The tube was sealed and heated at  $85^\circ\text{C}$  overnight with stirring. During initial heating, the reaction mixture became homogeneous. The tube was removed from the heat and allowed to cool to room temperature. Upon cooling a yellow, needle-like precipitate formed. The precipitate was collected on filter paper to give 3-amino-6-(3-chlorophenyl)pyrazine-2-carboxamide (53.9 mg, 88% yield) as a yellow solid:  $^1\text{H}$  NMR (400 MHz,  $\text{d}_6\text{-DMSO}$ ):  $\delta$  8.88 (s, 1H), 8.42 (br s, 2H), 8.30 (t, 1H), 8.11 (d, 1H), 7.69 (br s, 2H), 7.46-7.40 (m, 2H); MS (EI) for  $\text{C}_{11}\text{H}_9\text{N}_4\text{OCl}$ : 249 ( $\text{MH}^+$ ).

**Example 3****3-amino-N-methyl-6-[4-(tetrahydro-2H-pyran-2-yloxy)phenyl]pyrazine-2-carboxamide**

[0248] 3-amino-6-bromo-N-methyl-2-pyrazinecarboxamide: An ice-cooled solution of 50 g of methyl 3-amino-6-bromo-pyrazine-2-carboxylate in 500 mL of MeOH was saturated with methylamine gas. The reaction was then heated at 85 °C in a sealed, stainless steel Parr pressure vessel for 2 h, and cooled to room temperature, and then on an ice water bath. The mixture was concentrated to an oil on a rotary evaporator under reduced pressure. The crude oil was dissolved in EtOAc and washed with water, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated to give 43.9 g (88.0% yield) of product as a solid.

- [0288] N-methyl benzamides, where A is  $-\text{C}(=\text{O})-$  and E is  $-\text{N}(\text{H})\text{CH}_3$  according to formula I, were prepared in analogous fashion as described above starting from 3-Amino-6-bromo-pyrazine-2-carboxylic acid methylamide.
- [0289] Methyl 3-[5-amino-6-(methylamino)carbonyl] pyrazin-2-yl}benzoate: To a stirred mixture of 3-amino-6-bromo-pyrazine-2-carboxylic acid methylamide (2.29 g, 9.91 mmol, 1.00 equiv.), 3-methoxycarbonylphenylboronic acid (Digital Specialty Chemicals, Inc., 2.68 g, 14.9 mmol, 1.50 equiv.), triethylamine (2.90 g, 28.6 mmol, 2.88 equiv.) in 30 mL of DMF was added [1,1'-bis(diphenylphosphino)-ferrocene]dichloropalladium(II) complex with dichloromethane (1:1), (Aldrich Chemical Company, 405 mg, 0.496 mmol, 0.050 equiv.). The stirred mixture was warmed to 80-90 °C for 24 hr and then concentrated on a rotary evaporator under reduced pressure. The residue was dissolved in 250 mL of EtOAc, washed three times with 10 mL of 1 N aqueous NaOH, and then saturated aqueous NaCl. The organic solution was filtered through celite, and then concentrated on a rotary evaporator under reduced pressure. The crude product was purified by silica gel chromatography, using EtOAc as eluent, to afford the title compound (2.10 g, 74% yield).
- [0290] 3-{5-amino-6-[(methylamino)carbonyl]pyrazin-2-yl}benzoic acid: A flask was charged with methyl 3-[5-amino-6-(methylamino)carbonyl] pyrazin-2-yl}benzoate (2.86 g, 10 mmol) and 30 mL of a solution of 2 N aqueous NaOH. The mixture was refluxed

for 15 min. and then allowed to cool to room temperature. The mixture was extracted with ethyl acetate (10mL). The pH of the aqueous phase was adjusted to pH between 2 – 3 with 10% aqueous HCl with stirring. The resulting pale yellow solid product was collected by filtration, washed with water, and dried, to afford 3-{5-amino-6-[(methylamino)carbonyl]pyrazin-2-yl}benzoic acid (2.30 g 84.5% yield):  $^1\text{H}$  NMR (400 MHz; DMSO- $d_6$ ): 8.83 (s, 1H); 8.80 (s, 1H); 8.51 (s, 1H); 8.41 (d, 1H); 7.93 (d, 1H); 7.65 (br s, 2H); 7.58 (m, 1H); 2.84 (s, 3H); MS (EI) for  $\text{C}_{13}\text{H}_{12}\text{N}_4\text{O}_3$  : 273 ( $\text{MH}^+$ ).

## Example 5

3-amino-6-[3-(hydroxy-benzylcarbamoyl)-phenyl]-pyrazine-2-carboxylic acid methylamide isomers

[0449] Scheme 5 shows how 3-amino-6-[3-(hydroxy-benzylcarbamoyl)-phenyl]-pyrazine-2-carboxylic acid methylamide isomers were made. Methoxy benzylamines were demethylated via acidic hydrolysis to give the corresponding amine hydrobromide salts, (xxviii). These were used to make compounds (xxix) via amide forming reaction, for example using standard amide coupling reagents as depicted in Scheme 5. Exemplary details are set forth below.

### Example 8

#### 3-amino-N-methyl-6-[3-([(3-morpholin-4-ylphenyl)methyl]amino)methyl]phenyl]pyrazine-2-carboxamide

[0472] Scheme 7 shows how 3-amino-N-methyl-6-[3-([(3-morpholin-4-ylphenyl)methyl]amino)methyl]phenyl pyrazine-2-carboxamide was made. (4-Morpholin-4-yl-phenyl)-methanol (xxxiii) was converted to the corresponding amine (xxxiv). Amine (xxxiv) was used to make compound (xxxv) via amide forming reaction, for example using standard amide coupling reagents as depicted in Scheme 7. Exemplary details and further analogous examples are set forth below.

Scheme 7

[0473] A solution of (3-morpholin-4-ylphenyl)methanol (0.10 g, 0.52 mmol), in THF (1.0 mL) was cooled to 0°C and DPPA (0.13 mL, 0.62 mmol) was added, followed by DBU (0.093 mL, 0.62 mmol). The solution was allowed to warm to r.t. and stirred for 12h. The solution was poured into EtOAc (100 mL) and this was washed with H<sub>2</sub>O (50 mL) and 5% HCl(aq) (50 mL). The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo* to give 0.16 g (>100% yield) of 4-[3-(azidomethyl)phenyl]morpholine, (TLC: UV active spot, R<sub>f</sub> of 0.7 in 1:1 hexanes/EtOAc), which was used without further purification.

[0474] To a solution of 10% Pd/Carbon (0.030 g, 0.029 mmol) in 10% aqueous MeOH (4.2 mL) was added 4-[3-(azidomethyl)phenyl]morpholine (0.16 g, 0.71 mmol) in MeOH (4.2 mL), and the solution was stirred vigorously under a H<sub>2</sub>(g) balloon for 3 h. The solution was filtered through celite/fritted glass funnel and concentrated *in vacuo*. The crude residue was purified via HPLC (reverse-phase, CH<sub>3</sub>CN/H<sub>2</sub>O with 0.1% TFA) and fractions containing the desired product were concentrated *in vacuo*, to provide 0.064 g (29% yield) of [(3-morpholin-4-ylphenyl)methyl]amine trifluoroacetate.

[0475] A solution of 3-[5-amino-6-[(methylamino)carbonyl]pyrazin-2-yl]benzoic acid (0.081 g, 0.30 mmol), HOBt (0.048 g, 0.36 mmol) and HBTU (0.17 g, 0.45 mmol) in DMF (1.0 mL) was stirred at r.t. for 10 min. A solution of [(3-morpholin-4-ylphenyl)methyl]amine trifluoroacetate (0.13 g, 0.30 mmol) in DMF (1.0 mL) was added

and the resulting solution was stirred for 12 h at r.t. The solution was concentrated *in vacuo* and the crude mixture was purified via HPLC (reverse-phase, CH<sub>3</sub>CN/H<sub>2</sub>O with 0.1% TFA). Upon removal of CH<sub>3</sub>CN/H<sub>2</sub>O, the product was taken up in EtOAc (100 mL) and washed with 1M NaOH(aq) (50 mL). The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo*. Trituration and collection of a solid by vacuum filtration provided 11.6 mg (and treated with Bio-Rad AG 1-X8 resin (hydroxide form) until pH 8. The product was filtered and concentrated *in vacuo*, to provide 14.1 mg (9% yield) of 3-amino-*N*-methyl-6-[3-({[(3-morpholin-4-ylphenyl)methyl]amino}methyl)phenyl]pyrazine-2-carboxamide: <sup>1</sup>H NMR (400 MHz, d<sub>6</sub>-DMSO): 9.15 (t, 1H), 8.91 (s, 1H), 8.87 (m, 1H), 8.55 (s, 1H), 8.37 (d, 1H), 7.88 (d, 1H), 7.57 (t, 1H), 7.19 (t, 1H), 6.95 (s, 1H), 6.82 (m, 2H), 4.48 (d, 2H), 3.72 (t, 4H), 3.08 (t, 2H), 2.85 (d, 3H); MS (EI) for C<sub>24</sub>H<sub>26</sub>N<sub>6</sub>O<sub>3</sub>: 447 (MH<sup>+</sup>).

Nitrogen was passed through the solution for 3-5 min. The reaction mixture was heated at 85-90 °C for 15 h with stirring. The reaction was allowed to cool to room temperature and diluted with 400 mL of EtOAc. The mixture was washed with saturated aqueous NaHCO<sub>3</sub> (2 X 50.0 mL), saturated aqueous NaCl (1 X 50.0 mL), dried over magnesium sulfate (MgSO<sub>4</sub>), and filtered. The filtrate was concentrated on a rotary evaporator under reduced pressure. To the crude product was added 30 mL of a 4.0M solution of anhydrous HCl in dioxane. The resulting solid was filtered and rinsed with 20% methanol in diethyl ether to remove impurities. The solid was dissolved in methanol and neutralized with sufficient AG 1-X8 Resin (hydroxide form) that the pH of the solution became basic. The mixture was filtered, and the filtrate was concentrated on a rotary evaporator at reduced pressure to afford the title compound (0.695 g, 54% yield).

### Example 14

[0529] Scheme 8 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene or pyridylene, X is  $-SO_2NH-$  or  $-C(=O)NH-$  wherein the phenylene or pyridylene is attached to the sulfur or the carbon atom of X, and Y is attached to the nitrogen of X. As described above, W, X, and Y all are optionally substituted, but for simplicity this is not shown here. As depicted, intermediate (xxxvi) is incorporated into a compound of the invention, (xxxviii), where Z is N or C, and  $L_2$  is a substructure of X. In Scheme 8,  $L_2$  represents either  $-SO_2-$  or  $-C(=O)-$ . The sequence of transformations regarding such intermediates may vary depending on the nature of each of W, X, and Y. For example, when  $L_2$  is  $-SO_2-$ , the sulfonamide is typically generated prior to the conversion of the bromo group of (xxxvi) to the boronic ester group in intermediate (xxxvii). The same is true when  $L_2$  is  $-C(=O)-$  and W is pyridylene. In cases where W is a substituted benzene,  $L_2$  is  $-C(=O)-$ , and Y is an alkyl group, the amide bond is formed after the formation of (xxxviii) using synthetic steps known in the art. Conversion of (xxxvi) to (xxxvii) is carried out using bis(pinacolato)diboron based on procedures known to those skilled in the art. The transformation of (xxxvii) to (xxxviii) is accomplished using Suzuki coupling conditions, for example.

### Example 18

[0561] Scheme 9 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene, X is -CH<sub>2</sub>NH-, and Y is an indanyl group. Note, as defined above any of W, X, or Y are optionally substituted; this is only a set of examples. As depicted, intermediate (xxxix) is incorporated into a compound of the invention, (xliv). For example, optionally substituted indanone (xxxix) was to the corresponding alcohol (xl) using sodium borohydride or other appropriate reducing agent, depending upon, among other things, the substituent, R. The alcohol group in (xl) is transformed into an azide group in (xli) using diphenylphosphoryl azide and 1,8-diazabicyclo[5.4.0]undec-7-ene (DBU), for example. Reduction of azide (xli) is carried out typically, but not necessarily, using tin chloride give amine (xlii). Amine (xlii) is coupled to aldehyde (xlili), via reductive amination to afford (xliv). Amine (xlii) could also be coupled to a benzyl bromide, analogous to aldehyde (xxxxiii) to form (xliv), for example.

### Example 19

[0578] Scheme 10 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene, X is -CH<sub>2</sub>NR<sup>4</sup>-, and Y is various groups. Note, as defined above any of W, X, or Y are optionally substituted; this is only a set of examples. As depicted, primary amine (xlv), which in this example incorporates Y, is incorporated into a compound of the invention, (I). For example, amine (xlv), which has Y as part of its structure for example, is converted to 2,4-dinitrosulfonamide (xlv). Sulfonamide (xlv) is used to make sulfonamide (xlvii). The transformation (xlv) to (xlvii) is carried out either under alkylation (R<sup>4</sup>L<sub>3</sub>, where -L<sub>3</sub> is a leaving group) or Mitsunobu (R<sup>4</sup>OH) conditions. The sulfonamide bond is cleaved, typically but not necessarily via addition of a primary amine e.g. *n*-propyl amine, to free secondary amine (xlviii), which has Y and R<sup>4</sup> as part of its structure. Amine (xlviii) was then incorporated into compounds of the invention,

typically but not necessarily, via coupling to a benzyl bromide, for example (xlix), to make compound (I).

3-amino-6-[3-({[(2S)-6-bromo-1,2,3,4-tetrahydronaphthalen-2-yl]amino}methyl)phenyl]-N-methylpyrazine-2-carboxamide

**[0579] N-[(S)-6-bromo-1,2,3,4-tetrahydronaphthalen-2-yl]-2,4-**

**dinitrobenzenesulfonamide:** To a solution of (S)-6-bromo-2-aminotetraline (0.20g, 0.9 mmol) in tetrahydrofuran (2 mL) was added N,N-diisopropylethylamine at 0° C. A solution of 2,4-dinitrobenzenesulfonyl chloride (0.29g, 1.1 mmol) in tetrahydrofuran (2 mL) was added slowly *via* a syringe. The reaction was allowed to warm to room temperature and further stirred until the completion of the reaction (30 min) as monitored by thin layer chromatography. The crude reaction mixture was poured into a separatory funnel and diluted with ethyl acetate (250 mL) and washed with water (30 mL), saturated aqueous sodium chloride (40 mL), and dried over anhydrous magnesium sulfate. Filtration and concentration afforded the crude product. A pure N-[(2S)-6-bromo-1,2,3,4-tetrahydronaphthalen-2-yl]-2,4-dinitrobenzenesulfonamide (0.28g, 70% yield) was separated from trituration with ether/hexane (5:1, 30 mL) as a yellow solid. <sup>1</sup>NMR (400 MHz, CD<sub>3</sub>OD): 8.75 (s, 1H), 8.60 (dd, 1H), 8.38 (d, 1H), 7.22 (br s, 1H), 7.20 (d, 1H), 6.90 (d, 1H), 3.65 (m, 1H), 2.65 (m, 4H), 1.90 (m, 1H), 1.75 (m, 1H).

**[0580] 3-Amino-6-[3-({[(2S)-6-bromo-1,2,3,4-tetrahydronaphthalen-2-yl]amino}methyl)phenyl]-N-methylpyrazine-2-carboxamide:** To a solution of N-[(2S)-6-

bromo-1,2,3,4-tetrahydronaphthalen-2-yl]-2,4-dinitrobenzenesulfonamide (68 mg, 0.15 mmol) in N,N-dimethylformamide (1mL) were added solid potassium carbonate (0.10 g, 0.75 mmol) and 3-amino-6-[3-(bromomethyl)phenyl]-N-methylpyrazine-2-carboxamide (70 mg, 0.22 mmol). The reaction stirred overnight at room temperature and diluted with ethyl acetate (50 mL). The organic layer was washed with water (30 mL) and saturated aqueous sodium chloride (30 mL), and dried over magnesium sulfate. Filtration and concentration gave crude product that was used in the next step without any purification.

[0581] To the dichloromethane solution (2 mL) of the above product was added excess n-propylamine (0.5mL) and stirred for 30 min. The organic solvent and excess reagent were removed at reduced pressure. Column purification on silica (9:1, ethyl acetate/methanol) gave an oily product.

[0582] To a solution of the above product in methanol (2 mL) was added 4.0 N hydrochloric acid (1,4-dioxane solution, 1.50 mL) and stirred for 40 min. Evaporation of the excess reagent and solvent, washing with diethyl ether afforded 3-amino-6-[3-(((2S)-6-bromo-1,2,3,4-tetrahydronaphthalen-2-yl)amino)methyl]phenyl]-N-methylpyrazine-2-carboxamide (16 mg, 23% yield) as hydrochloric acid salt. <sup>1</sup>NMR (400 MHz, CDCl<sub>3</sub>): 8.62 (s, 1H), 8.02 (br s, 1H), 7.82 (br s, 1H), 7.75 (d, 1H), 7.40 (m, 2H), 7.20 (m, 2H), 6.74 (d, 1H), 4.01 (m, 2H), 2.90 (m, 6H), 2.60 (m, 2H), 2.12 (m, 1H), 1.70 (m, 1H); MS (EI) for C<sub>23</sub>H<sub>24</sub>N<sub>5</sub>OBr: 466 (MH<sup>+</sup>).

[0583] Using the same or analogous synthetic techniques and/or substituting with alternative reagents as described above, the following compounds of the invention were prepared:

### Example 25

- [0619] Scheme 11 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene, X is -C(=O)NHCH<sub>2</sub>-, and Y is a 3,4-dihydro-2H-benzo[1,4]oxazinyl group. As depicted, intermediate (li) is incorporated into a compound of the invention, (lvii). Nitro phenol (li) was reduced to aniline (lii). Then the aniline nitrogen was acylated to give intermediate

(liii). A ring closure was effected to yield intermediate (liv). Reduction of the cyano group gave (lv), followed by reduction of the carbonyl giving primary amine (lvi). Amine (lvi) was coupled to an acid to yield compounds of the invention, for example (lvii) as depicted below.

[0638] Scheme 13 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene, X is  $-\text{C}(=\text{O})\text{NHCH}_2-$ , and Y is an indanyl group. As depicted, intermediate (Ix), is incorporated into (Ixxvii), a compound of the invention. 1-Amino-2,3-dihydro-R1,R2-substituted-1H-indene(s) were obtained from commercial sources or were prepared from cinnamic acids (or aryl propionic acids) by methods known to those skilled in the art as depicted in Scheme 13. Cinnamic acids (Ix) were hydrogenated to afford acids (Ixi). Acids (Ixi) were converted to the corresponding acyl chlorides and subjected to electrophilic aromatic substitution conditions to afford ketones (Ixxiii). Ketones (Ixxiii) were reduced to the corresponding alcohols (Ixxiv), and the alcohols subsequently converted to the corresponding azides (Ixxv). Azides (Ixxv) were reduced to form the

corresponding 1-aminoindanes (lxvi). Note, azides (lxv) with chloro- or bromo-substitution on phenyl ring portion were reduced to the 1-aminoindanes (lxvi) using  $\text{SnCl}_2$  in ethyl acetate, typically. Aminoindanes (lxvi) were incorporated into compounds of the invention, e.g. (lxvii), via reductive amination, for example, as depicted. As mentioned, amines were also incorporated via coupling with corresponding benzyl bromides to give, for example, compounds (lxvii).

### Example 32

[0655] Scheme 14 shows, analogously to Scheme 13 above, that 2-aminoindan-1-ols were also prepared for incorporation into compounds of the invention. Ketones (Ixiii) were converted to azides (Ixviii), followed by reduction to 2-aminoindan-1-ols (Ixix). These amino alcohols were used to make compounds of the invention, for example compounds (Ixx), as depicted below.

Scheme 14

3-amino-6-(3-[[[(4-fluoro-1-hydroxy-2,3-dihydro-1H-inden-2-yl)amino]methyl]phenyl]-N-methylpyrazine-2-carboxamide

[0656] A solution of 4-fluoro-2,3-dihydro-1*H*-inden-1-one (1.29 g, 9.34 mmol) and HNIB (5.02 g, 12.1 mmol) in CH<sub>3</sub>CN (190.0 mL) was refluxed for 1.5 h, until the solution was clear yellow. Upon cooling to r.t., NaN<sub>3</sub> (1.21 g, 18.7 mmol) was added and the solution was stirred at r.t. for 12 h. Additional NaN<sub>3</sub> (0.50 g, 7.7 mmol) was added and the solution stirred further at r.t. for 4 h. The reaction mixture was concentrated *in vacuo*, and the residue was taken up in CH<sub>2</sub>Cl<sub>2</sub> (100 mL). This solution was washed with H<sub>2</sub>O (75 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo*. The residue was purified via column chromatography (SiO<sub>2</sub>, 5:1 hexanes/EtOAc) to give 1.61 g (96% yield) of 2-azido-4-fluoro-2,3-dihydro-1*H*-inden-1-one: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): 7.59 (d, 1H), 7.41 (m, 1H), 7.32 (t, 1H), 4.15 (dd, 1H), 3.55 (dd, 1H), 2.89 (dd, 1H).

[0657] To a solution of 2-azido-4-fluoro-2,3-dihydro-1*H*-inden-1-one (0.81 g, 4.5 mmol) in MeOH (15.0 mL), was added NaBH<sub>4</sub> (0.19 g, 4.5 mmol) in one portion. After stirring for 10 min at r.t., the solution was concentrated *in vacuo*. The residue was taken up in EtOAc (100 mL), and this solution was washed with saturated NaHCO<sub>3</sub> (aq) (50 mL), dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo* to give 0.64 g (73% yield) of 2-azido-4-fluoro-2,3-dihydro-1*H*-inden-1-ol as a white solid, which was used without further purification: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): 7.23 (m, 2H), 6.97 (t, 1H), 5.15 (dd, 1H), 4.37 (q, 1H), 3.17 (d, 1H), 2.40 (d, 1H).

[0658] A solution of 10% Pd/Carbon (0.070 g, 0.50 mmol), in EtOAc (7.0 mL) was stirred under a H<sub>2</sub> (g) balloon for 2 h, after which time a solution of 2-azido-4-fluoro-2,3-dihydro-1*H*-inden-1-ol (0.98 g, 5.1 mmol) and Boc<sub>2</sub>O (1.3 g, 6.1 mmol) in EtOAc (3.0 mL) was added. The mixture was stirred under a H<sub>2</sub> (g) balloon at r.t. for 12 h. Filtration through celite/fritted glass funnel and concentration *in vacuo* gave a crude residue, which was purified via column chromatography (SiO<sub>2</sub>, 3:1 hexanes/EtOAc) to give 0.62 g (46% yield) of 1,1-dimethylethyl (4-fluoro-1-hydroxy-2,3-dihydro-1*H*-inden-2-yl)carbamate: <sup>1</sup>H NMR (400 MHz, CDCl<sub>3</sub>): 7.18 (m, 2H), 6.94 (m, 1H), 5.21 (bs, 0.5H), 5.03 (bs, 0.5H), 4.37 (bs, 0.5H), 4.10 (q, 0.5H), 3.24-3.40 (m, 1H), 2.59-2.86 (m, 1H), 1.44 (s, 9H).

[0659] To a solution of 1,1-dimethylethyl (4-fluoro-1-hydroxy-2,3-dihydro-1*H*-inden-2-yl)carbamate (0.30 g, 1.1 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (10 mL) was added TFA (1 mL), and the solution was heated to reflux. The solution was immediately cooled and concentrated *in vacuo*. The residue was taken up in MeOH and treated with Bio-Rad AG 1-X8 resin (hydroxide form) until pH 8. The product was filtered and concentrated *in vacuo* to give

Upon cooling, saturated NaHCO<sub>3</sub> (aq) was added (25 mL). The aqueous layer was extracted with EtOAc (2 x 25 mL). The combined organic layers were dried (Na<sub>2</sub>SO<sub>4</sub>), filtered and concentrated *in vacuo*. ## Example 36

[0677] Scheme 15 depicts a general synthetic route for compounds of the invention having substituents -W-X-Y according to formula I, wherein, for example, W is phenylene, X is -CH<sub>2</sub>NH-, and Y is various groups. Note, as defined above any of W, X, or Y are optionally substituted; this is only a set of examples. Analogous to Scheme 10, primary amine (xlv), which in this example incorporates Y, is incorporated into a compound of the invention, (lxxiii). For example, amine (xlv), which has Y as part of its structure for example, is converted to 2,4-dinitrosulfonamide (xlvi). Sulfonamide (xlvi) is used to make sulfonamide (lxxii). The transformation (xlvi) to (lxxii) is carried out under Mitsunobu conditions, in this case where the alcohol partner is intermediate, compound of the invention, (lxxi). As described above in relation to Scheme 10, the sulfonamide bond is cleaved, typically but not necessarily via addition of a primary amine e.g. *n*-propyl amine, to free secondary amine (lxxiii), which in this case is a compound of the invention.

[0678] N-[(1S)-2,3-dihydro-1H-inden-1-yl]-2,4-dinitrobenzenesulfonamide: To a stirred, ice-cooled solution of 4.00 g of (S)-(+)-1-aminoindan (30.0 mmol, from Sigma-Aldrich) in 113 mL of THF was added 9.60 g (36.0 mmol, 1.20 eq.) of 2,4-dinitrobenzenesulfonyl chloride, followed by 7.80 mL (44.8 mmol, 1.49 eq.) of N,N-diisopropylethylamine. The ice bath was removed, and the mixture was stirred at room temperature for 19 h and then concentrated. The residue was taken up in EtOAc, washed with 2 x H<sub>2</sub>O, dried over Na<sub>2</sub>SO<sub>4</sub>, filtered, and concentrated. The residue was sonicated in ca. 30 mL of EtOAc

until a precipitate was formed. The mixture was diluted to ca. 150 mL with hexanes. Filtration afforded pure product as a tan solid (8.59 g, 78.8% yield).

[0679] Triphenylphosphine (6.9 g, 26 mmol) was added to a stirred solution of 2-amino-5-[3-(hydroxymethyl)phenyl]-N-methylpyridine-3-carboxamide (5.16 g, 20 mmol) and N-[(1S)-2,3-dihydro-1H-inden-1-yl]-2,4-dinitrobenzenesulfonamide (9.4 g, 26 mmol) in benzene (150 mL). Diethyl azodicarboxylate (4.5 g, 26 mmol) was then added drop wise and mixture was stirred at ambient temperature for 4 h. Ethyl acetate (400 mL) was added and the organic layer was washed with saturated aqueous sodium chloride then dried ( $\text{Na}_2\text{SO}_4$ ). Filtration and concentration followed by column chromatography (ethyl acetate/hexane, 9:1) gave desired product (8.2 g, 50 % yield).

[0680] 2-amino-5-(3-([(1S)-2,3-dihydro-1H-inden-1-ylamino]methyl)phenyl)-N-methylpyridine-3-carboxamide: 2-Amino-5-(3-([(2,4-dinitrophenyl)sulfonyl][(1S)-2,3-dihydro-1H-inden-1-yl]amino)methyl)phenyl)-N-methylpyridine-3-carboxamide was treated with excess n-propylamine (4 eq) in  $\text{CH}_2\text{Cl}_2$  (150 mL). The mixture was diluted with additional ethyl acetate (200 mL). The mixture was subsequently washed with aqueous saturated sodium carbonate (3 x 30 mL) and brine (3 x 30 mL). The combined organic fractions were dried over anhydrous sodium sulfate, filtered and concentrated in vacuo. Purification of the residue by preparative HPLC (acetonitrile/water) gave desired product (5.8 g). ### Example 53

[0847] Scheme 18 shows how alcohols were converted to amines to make compounds according to formula I. In this example, alcohol (Ixxxi) is converted to the corresponding azide (Ixxxii), which was reduced to the corresponding amine (Ixxxiii). Amines (Ixxxiii) were, for example, acylated, subjected to reductive amination, and the like to make compounds according to formula I.

### Example 57

[0893] Scheme 21 depicts a strategy for making imidoates according to formula I. Nitrile (xci) is converted to the corresponding imidoate, (xcii), for example, as described below. Such imidoates are generally used as intermediates to make, for example, compounds according to formula I where A is a triazole, or oxadiazole, and the like as one skilled in the art could readily perform. For example addition of benzenecarboximidamide to imidoate (xcii) under appropriate conditions (e.g. heat and dehydrative conditions) would give the corresponding triazole derivative (xciii). Some exemplary compounds are listed in this example.

## Example 58

[0909] Scheme 22 depicts another strategy for making exemplary compounds according to formula I where A is a triazole. Boronic acid-acyl chloride intermediate (xciv) is coupled with amine (xcv) to give amide (xcvi). Intermediate (xcvi) is coupled to a bromopyrazine, for example, to give intermediate (xcvii). The nitrile group of (xcvii) is converted to the corresponding triazole to yield (xcviii), for example, as more fully described below. Intermediate (xcvii) can also be used to make other heterocycles for A, according to formula I. Included in this example are other various triazole syntheses that generally start from a corresponding nitrile precursor.

3-(5-amin-6-cyano-pyrazin-2-yl)-N-[(4-chloro-2-fluorophenyl)methyl]benzamide

[0910] 4-Carbonyl chloride phenylboronic acid (350 mg, 1.90 mmol) was added to THF followed by addition of 4-chloro-2-fluorobenzylamine (466 mg, 2.37 mmol) and triethylamine (400  $\mu$ l, 2.85 mmol). This mixture was stirred at room temperature under nitrogen overnight. The reaction mixture was poured into water (75 mL), and extracted with ethyl acetate (2  $\times$  50 mL) then dried over anhydrous sodium sulfate and filtration,

concentration to give crude reduction product, 525 mg (90.0% yield). Subsequently it was dissolved in DMF followed by addition of 3-amino-6-bromo-pyrazine-2-carbonitrile (169 mg, 0.85 mmol), Pd(dppf)CH<sub>2</sub>Cl<sub>2</sub> (69.2 mg, 10 mol%) and triethylamine (118  $\mu$ L, 2.12 mmol). It was heated to 80 °C for 16 hrs and quenched with H<sub>2</sub>O and extracted with ethylacetate then dried over anhydrous sodium sulfate and filtration, concentration to give crude reduction product (275 mg, 85.0% yield): MS (EI) for C<sub>19</sub>H<sub>13</sub>ClFN<sub>5</sub>O: 382.14 (MH<sup>+</sup>).

[0911] 3-(5-amino-6-{3-[(3S)-piperidin-3-yl]-1H-1,2,4-triazol-5-yl}pyrazine-2-yl)-N[4-chloro-2-fluorophenyl)methyl]benzamide: 3-(5-Amino-6-cyano-pyrazin-2-yl)-N-(4-chloro-2-fluoro-benzyl)-benzamide (238.0 mg, 0.63 mmol) and 1,1-dimethylethyl (3S)-3-(hydrazinocarbonyl)piperidine-1-carboxylate (460 mg, 1.89 mmol) was combined together and it was heated to 180 °C for 1 or 2 hrs. The reaction mixture was poured into water (575 mL), and extracted with ethyl acetate (2  $\times$  35 mL) then dried over anhydrous sodium sulfate and filtration, concentration and purified by MPLC to give 3-[5-amino-6-(5-piperidin-3-yl-2H-[1,2,4]triazol-3-yl)-pyrazin-2-yl]-N-(4-chloro-2-fluoro-benzyl)-benzamide (206.0 mg, 65.0% yield): <sup>1</sup>H NMR (400 MHz, d<sub>4</sub>-MeOH):  $\delta$  8.60 (d, 2H), 8.20 (d, 1H), 7.82 (d, 1H), 7.58 (t, 1H), 7.38 (t, 1H), 7.15 (m, 2H), 4.60(s, 2H), 3.62 (m, 1H), 3.40(m, 3H), 2.99 (m, 1H), 2.37 (m, 1H), 1.98 (m, 3H); MS (EI) for C<sub>25</sub>H<sub>24</sub>N<sub>8</sub>OFCI: 507.03 (MH<sup>+</sup>).

[0912] 1-(1,1-dimethylethyl) 3-ethyl (3S)-piperidine-1,3-dicarboxylate: To an ice-cooled, stirred solution of (S) – (+) – ethyl nipecotate (3.95 g, 25.1 mmol, from Sigma-Aldrich) in 20 mL of THF, was added 8.21 g (37.6 mmol, 1.5 eq.) of di-*tert*-butyl dicarbonate. The ice bath was removed, and the reaction stirred at room temperature for 19 h and concentrated. The crude oil was purified by silica gel chromatography (55 mm column, 5 inches of silica gel) using 15% EtOAc in hexanes as eluent. Concentration afforded 6.28 g (97.2% yield) of product as an oil.

[0913] 1,1-dimethylethyl (3S)-3-(hydrazinocarbonyl)piperidine-1-carboxylate: To a solution of 6.28 g (24.4 mmol) of 1-(1,1-dimethylethyl) 3-ethyl (3S)-piperidine-1,3-dicarboxylate in 25 mL of MeOH was added 7.11 mL of hydrazine monohydrate (146 mmol, 5.98 eq.). The mixture was refluxed for 2 h and concentrated. The reaction could be monitored by LC/MS on a reversed-phase column at 220 nm wavelength. The crude material was taken up in EtOAc, and washed with 2  $\times$  H<sub>2</sub>O, 1  $\times$  sat. aqueous NaCl, and dried over Na<sub>2</sub>SO<sub>4</sub>. Filtration and concentration afforded 3.21 g of product (54.0% yield)

### Example 63

Synthesis of compounds according to formula I, wherein A is  $-(C=O)-$  or  $-(C=NR^6)-$  derived from methyl 3-amino-2-pyrazine carboxylate.

[0972] Methyl 3-amino-6-bromopyrazine-2-carboxylate. To a solution of methyl 3-amino-2-pyrazine carboxylate (30.0 g, 200 mmol) in acetic acid (200 mL), bromine (11 mL) was added slowly via addition funnel. After complete addition of bromine, sodium carbonate powder was added slowly until precipitation occurred. The reaction mixture was allowed to stir at room temperature for 2 h. The reaction mixture was reduced to half-volume in vacuo and then diluted with water (500 mL). The reaction mixture was shaken vigorously and the resulting solid was collected using vacuum filtration. The solid was washed with ether to afford a pure yellow solid (91 % yield).

140 mmol) was added. The reaction mixture was stirred at room temperature and monitored by LCMS. The reaction was complete after 1 h. The reaction mixture was poured into 1 N HCl (250 mL), extracted with ethyl acetate (3x, 200 mL), washed with brine (3x, 100 mL), dried over anhydrous sodium sulfate, filtered and concentrated to afford a yellow solid (100 % yield).

[0978] 3-(5-Amino-6-[(1E)-N-[4-(methyloxy)phenyl]ethanehydrazonoyl]pyrazin-2-yl)-N-(phenylmethyl)benzamide: A solution of 3-amino-6-{3-[(benzylamino)carbonyl]phenyl}-N-methoxy-N-methylpyrazine-2-carboxamide (0.10 g, 0.25 mmol) in THF (5 mL) was cooled to 0 °C, and a solution of  $\text{CH}_3\text{MgCl}$  (0.75 mL, 1 M in THF, 3.0 equiv.) was added slowly. The mixture was allowed to warm to room temperature over 1.5 hr. The mixture was then cooled to 0 °C and quenched slowly with saturated  $\text{NH}_4\text{Cl}$  solution. [0979] 3-(5-Amino-6-formylpyrazin-2-yl)-*N*-benzylbenzamide: A solution of 3-amino-6-{3-[(benzylamino)carbonyl]phenyl}-*N*-methoxy-*N*-methylpyrazine-2-carboxamide (2.5 g, 6.4 mmol) in THF (20 mL) was cooled to 0 °C. Under  $\text{N}_2$  lithium aluminum hydride (0.364g, 9.58 mmol) was added and the reaction was stirred at 0 °C for 1 h. The mixture was then quenched with  $\text{H}_2\text{O}$  at 0 °C. Removal of solids via filtration, concentration of the filtrate and dissolution of the solid residue in  $\text{H}_2\text{O}$  followed by washing 3x with dichloromethane gave the product (1.90 g, 89 % yield) with sufficient purity to be used without further purification.

[0980] 3-[5-Amino-6-(morpholin-4-ylmethyl)pyrazin-2-yl]-*N*-(phenylmethyl)benzamide: 3-(5-Amino-6-formylpyrazin-2-yl)-*N*-benzylbenzamide (1.27 g, 3.83 mmol) was dissolved in dichloroethane (30 mL) at 0 °C. Morpholine (400 mg, 4.6 mmol), and  $\text{NaBH}(\text{OAc})_3$  (2.03 g, 9.58 mmol) were added and the reaction was stirred at room temperature for 20 h. The reaction mixture was diluted with saturated sodium carbonate and extracted 3x with ethyl acetate. The combined ethyl acetate layers were dried over sodium sulfate, filtered, and concentrated *in vacuo* to afford the product (1.41 g, 88 % yield).  $^1\text{H}$  NMR (400 MHz,  $d_4$ - $\text{CD}_3\text{OD}$ ):  $\delta$  8.60 (s, 1H), 8.47 (t, 1H), 8.12 (m, 1H), 7.84 (m, 1H), 7.55 (t, 1H), 7.31-7.89 (m, 4H), 7.23-7.26 (m, 1H), 4.61 (s, 2H), 4.43 (s, 2H), 3.32-4.16 (m, 8H). #### Example 64

##### 3-Amino-6-{3-[(3-fluoro-5-(trifluoromethyl)phenyl)methyl]amino}carbonyl phenyl}-N-[(3S)-piperidin-3-yl]pyrazine-2-carboxamide

- [1278] To a solution of 3-[5-amino-6-((3S)-1-(tert-butoxycarbonyl)piperidine-3-yl)amino]carbonylpyrazine-2-yl]benzoic acid (80 mg, 0.18 mmol) in dry dichloromethane (1.0 mL) were added 1-ethyl-(3-dimethylaminopropyl)carbodiimide hydrochloride (EDC, 48 mg, 0.25 mmol) and 1-hydroxybenzotriazole (HOBt, 34 mg, 0.25 mmol). The reaction mixture was stirred for 10-15 min at room temperature. A solution of 3-fluoro-4-(trifluoromethyl)benzylamine (52 mg, 0.27 mmol) in dichloromethane (1 mL) was added and stirring continued for 2-3 h. Reaction was diluted with ethyl acetate (150 mL), washed with saturated aqueous sodium bicarbonate (40 mL) and saturated aqueous sodium chloride (50 mL). Dried over anhydrous magnesium sulfate, filtered, concentrated, and purification on silica (7:3 hexanes/ethyl acetate) afforded the amide product. MS (EI) for  $\text{C}_{25}\text{H}_{28}\text{N}_6\text{O}_2\text{F}_4$ : 517 [ $(\text{M-boc})\text{H}^+$ ].
- [1279] To a solution of the above amide in methanol (2 mL) was added 4.0 N hydrochloric acid (1,4-dioxane solution, 1 mL) and the reaction stirred until the deprotection (removal of Boc-protecting group) was completed as monitored by thin layer chromatography. The excess reagent and solvent was removed at reduced pressure to give a solid product which was washed further with ethyl acetate (50 mL) to afford the hydrochloric acid salt of 3-amino-6-{3-[(3-fluoro-5-(trifluoromethyl)phenyl)methyl]}

### Example 65

#### 3-amino-6-[3-([(3-chloro-2,6-difluorophenyl)methyl]amino)carbonyl]phenyl]-N-[(3S)-piperidin-3-yl]pyrazine-2-carboxamide

[1287] To a solution of tert-butyl (3S)-3-([(3-amino-6-[3-(methoxycarbonyl)phenyl]pyrazin-2-yl]carbonyl)amino]piperidine-1-carboxylate (100 mg, 0.22 mmol) in tetrahydrofuran/water (4:1, 1.5 mL) was added 0.5 N aqueous lithium hydroxide (0.5 mL, 0.55 mmol) and the reaction was stirred at room temperature overnight. Reaction was diluted with dichloromethane (4 mL) and treated with 0.5 N aqueous hydrochloric acid (0.5 mL). The aqueous layer was discarded. The crude acid in dichloromethane solution was treated with 1-ethyl-(3-dimethylaminopropyl)carbodiimide hydrochloride (EDCI, 63 mg, 0.33 mmol) and 1-hydroxybenzotriazole (HOBT, 45 mg, 0.33 mmol). The reaction was stirred for 10-15 min and then a solution of 5-chloro-1,6-difluorobenzylamine (46 mg, 0.26 mmol) in dichloromethane (0.5 mL) was added. The reaction was stirred for 2-3 h and diluted with ethyl acetate (150 mL). The organic layer was washed with saturated aqueous sodium bicarbonate (40 mL), saturated aqueous sodium chloride (50 mL), and dried over anhydrous magnesium sulfate. Filtration, concentration, and purification on silica (3:7 hexanes/ethyl acetate) afforded the boc-protected intermediate. MS (EI) for  $\text{C}_{24}\text{H}_{23}\text{N}_6\text{O}_2\text{F}_2\text{Cl}$ : 501, 503 [(M-boc) $\text{H}^+$ ].

[1288] To a solution of the above intermediate in methanol (2 mL) was added 4.0 N hydrochloric acid (1,4-dioxane solution, 1 mL) and the reaction stirred until the deprotection was completed as monitored by thin layer chromatography. The excess reagent and solvent was removed at reduced pressure to give a solid product which was washed further with ethyl acetate (50 mL) to afford the hydrochloric acid salt of 3-amino-6-[3-([(3-chloro-2,6-difluorophenyl)methyl]amino)carbonyl]phenyl]-N-[(3S)-piperidin-3-yl]pyrazine-2-carboxamide (76 mg, 69% yield) as yellow solid  $^1\text{H}$  NMR (400 MHz,

### Example 66

#### 3-amino-6-(3-(((2-methylphenyl)acetyl)amino)phenyl)-N-[(3S)-piperidin-3-yl]pyrazine-2-carboxamide

- [1323] To a solution of 2-methylphenylacetic acid (45 mg, 0.30 mmol) in dry dichloromethane (1.0 mL) were added 1-ethyl-(3-dimethylaminopropyl)carbodiimide hydrochloride (EDCI, 72 mg, 0.38 mmol) and 1-hydroxybenzotriazole (HOBT, 51 mg, 0.38 mmol). The reaction mixture was stirred for 10-15 min at room temperature. A solution of tert-butyl (3S)-3-(((3-amino-6-(3-aminophenyl)pyrazin-2-

yl]carbonyl}amino)piperidine-1-carboxylate (80 mg, 0.20 mmol) in dichloromethane (1 mL) was added and stirring continued for 2-3 h. Reaction was diluted with ethyl acetate (150 mL), washed with saturated aqueous sodium bicarbonate (40 mL) and saturated aqueous sodium chloride (50 mL). Dried over anhydrous magnesium sulfate, filtered, concentrated, and purification on silica (hexanes/ethyl acetate, 3:7) afforded the protected intermediate. MS (EI) for  $C_{25}H_{28}N_6O_2$ : 445 [(M-boc)H<sup>+</sup>].

[1324] To a solution of the above intermediate in methanol (2 mL) was added 4.0 N hydrochloric acid (1,4-dioxane solution, 1 mL) and the reaction stirred until the deprotection was completed as monitored by thin layer chromatography. The excess reagent and solvent was removed at reduced pressure to give a solid product which was washed further with ethyl acetate (50 mL) to afford the hydrochloric acid salt of 3-amino-6-(3-[(2-methylphenyl)acetyl]amino)phenyl)-N-[(3S)-piperidin-3-yl]pyrazine-2-carboxamide (56 mg, 63% yield) as yellow solid. <sup>1</sup>NMR (400 MHz, d<sub>6</sub>-DMSO): 10.72 (s, 1H), 9.20 (br s, 1H), 9.04 (br s, 1H), 8.80 (s, 1H), 8.70 (d, 1H), 8.45 (s, 1H), 7.80 (d, 1H), 7.40 (m, 2H), 7.18 (m, 3H), 4.32 (m, 1H), 3.80 (s, 2H), 3.25 (m, 3H), 2.80 (m, 1H), 2.3 (s, 3H), 1.80 (m, 4H); MS (EI) for  $C_{25}H_{28}N_6O_2$ : 445 (MH<sup>+</sup>).

Pinza, and G. Pifferi, *Synthesis*, 1978, 614 – 616. (3S)-3-[(Triphenylmethyl)amino]azepan-2-one and (3S)-N-(triphenylmethyl)azepan-3-amine were prepared using similar methods.
- [1354] 1,1-dimethylethyl (3S)-3-[(triphenylmethyl)amino]azepane-1-carboxylate: To an ice-cooled, stirred solution of (3S)-N-(triphenylmethyl)azepan-3-amine (30.0 mmol) in 60 mL of THF, was added 9.85 g (45.1 mmol, 1.5 eq.) of di-*tert*-butyl dicarbonate. The ice bath was removed, and the reaction stirred at room temperature for 19 h and concentrated. The crude oil was purified by silica gel chromatography (55 mm column, 7.5 inches of silica gel) using 10% EtOAc in hexanes as eluent. Concentration afforded 13.7 g (100% yield) of product as a solid.
- [1355] 1,1-dimethylethyl (3S)-3-aminoazepane-1-carboxylate: To 13.7 g (30 mmol) of 1,1-dimethylethyl (3S)-3-[(triphenylmethyl)amino]azepane-1-carboxylate was carefully added 100 mL MeOH, 75 mL EtOH, and 1.00 g of 10% Palladium on charcoal. The mixture was hydrogenated on a Parr shaker under 30 psi of hydrogen gas for 15 h. The mixture was filtered through a pad of celite, and the filtrate concentrated to afford a quantitative yield (6.43 g) of product. The product was used as such without further purification.
- [1356] 1,1-dimethylethyl (3S)-3-{{[(3-amino-6-bromopyrazin-2-yl)carbonyl]amino}azepane-1-carboxylate: A flask was charged with 6.43 g (30 mmol) of 1,1-dimethylethyl (3S)-3-aminoazepane-1-carboxylate, 109 mL THF, 5.49 g of 3-amino-6-bromopyrazine-2-carboxylic acid (25.2 mmol, 0.84 eq.), 5.00 mL TEA (35.9 mmol, 1.20 eq.), 5.11 g

(37.8 mmol, 1.26 eq.) of 1-hydroxybenzotriazole (HOBT), and 7.25 g (37.8 mmol, 1.26 eq.) of 1-[3-(dimethylamino)propyl]-3-ethylcarbodiimide hydrochloride (EDCI). The reaction was allowed to stir for 16 h. The reaction was diluted with EtOAc, washed with 2 x sat. aqueous NaHCO<sub>3</sub>, 1 x sat. aqueous NaCl, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. The crude material was purified by silica gel chromatography on a 55 mm column (7.5 inches of silica gel) using 30 – 50% EtOAc in hexanes as eluent. Concentration afforded 4.57 g (43.8% yield) of product as a solid.

[1357] The 1,1-dimethylethyl (3S)-3-[[3-(3-amino-6-bromopyrazin-2-yl)carbonyl]amino]azepane-1-carboxylate could be used in a manner analogous to that used for 1,1-dimethylethyl (3S)-3-[[3-(3-amino-6-bromopyrazin-2-yl)carbonyl]amino]piperidine-1-carboxylate to prepare compounds that are part of the invention.

### Example 70

[1372] Scheme 26 depicts another strategy for making exemplary compounds according to formula I where A is a triazole. Nitrile intermediates (cvi) were converted to aminoamidines (cvii), which were acylated and the intermediates cyclized to form

triazoles (cviii). Intermediate (cvi) can also be used to make other heterocycles for A, according to formula I.

- [1409] Scheme 27 depicts another strategy for making exemplary compounds according to formula I where A is a pyrimidine. Weinreb's amide intermediates (cix) were converted to α,β-unsaturated intermediates (cx), which were coupled with amidines and the intermediates cyclized to form pyrimidines (cxi). Intermediate (cix) can also be used to make other heterocycles for A, according to formula I.

Saturated ammonium chloride was added and the mixture was extracted 3x with ethyl acetate. The combined organic layers were dried over sodium sulfate, filtered, and concentrated under reduced pressure. LCMS analysis showed desired product and complete consumption of starting material. The reaction mixture was

concentrated under reduced pressure and redissolved in ethanol (10 mL). Guanidine (0.364 g, 2.0 mmol) was added followed by potassium carbonate (0.80 g, 5.8 mmol). ### Assays

[1439] Chk1 and Chk2 assays were performed by measuring incorporation of  $\gamma$ - $^{33}P$  ATP into immobilized myelin basic protein (MBP). High binding white 384 well plates (Greiner) were coated with MBP (Sigma #M-1891) by incubation of 60 $\mu$ l/well of 20 $\mu$ g/ml MBP in Tris-buffered saline (TBS; 50mM Tris pH 8.0, 138mM NaCl, 2.7mM KCl) for 24 hours at 4° C. Plates were washed 3X with 100 $\mu$ l TBS. Kinase reactions were carried out in a total volume of 34 $\mu$ l in kinase buffer (5mM Hepes pH 7.6, 15mM NaCl, 0.01% bovine gamma globulin (Sigma #I-5506), 10mM  $MgCl_2$ , 1mM DTT, 0.02% TritonX-100). Compound dilutions were performed in DMSO and added to assay wells to a final DMSO concentration of 1%. Each data point was measured in duplicate, and at least two duplicate assays were performed for each individual compound determination. Chk1 and Chk2 enzymes (Upstate Biotechnology) were added to final concentrations of 10nM (Chk1) or 20nM (Chk2). A mixture of unlabeled ATP and  $\gamma$ - $^{33}P$  ATP was added to start the reaction ( $2 \times 10^6$  cpm of  $\gamma$ - $^{33}P$  ATP per well (3000Ci/mmol) and either 10 $\mu$ M or 30 $\mu$ M unlabeled ATP (for Chk1 and Chk2 assays respectively). The reaction was carried out for 1 hour at room temperature with shaking. Plates were washed 7x with TBS, followed by the addition of 50 $\mu$ l/well scintillation fluid (Wallac). Plates were read using a Wallac Trilux counter. This is only one format of such assays, various other formats are possible, as known to those skilled in the art.

[1440] The above assay procedure can be used to determine the  $IC_{50}$  for inhibition and/or the inhibition constant  $K_i$ . The  $IC_{50}$  is defined as the concentration of compound required to reduce the enzyme activity by 50% under the conditions of the assay. Exemplary

compositions have IC<sub>50</sub>'s of, for example, less than about 100 μM, less than about 10 μM, less than about 1 μM, and further for example having IC<sub>50</sub>'s of less than about 100 nM, and still further, for example, less than about 10 nM. The K<sub>i</sub> for a compound may be determined from the IC<sub>50</sub> based on three assumptions. First, only one compound molecule binds to the enzyme and there is no cooperativity. Second, the concentrations of active enzyme and the compound tested are known (i.e., there are no significant amounts of impurities or inactive forms in the preparations). Third, the enzymatic rate of the enzyme-inhibitor complex is zero. The rate (i.e., compound concentration) data are fitted to the equation:

$$V = V_{\max} E_0 \left[ I - \frac{(E_0 + I_0 + K_d) - \sqrt{(E_0 + I_0 + K_d)^2 - 4E_0 I_0}}{2E_0} \right]$$

[1441] Where V is the observed rate, V<sub>max</sub>, is the rate of the free enzyme, I<sub>0</sub> is the inhibitor concentration, E<sub>0</sub> is the enzyme concentration, and K<sub>d</sub> is the dissociation constant of the enzyme-inhibitor complex.

#### Kinase specificity assays:

[1442] Kinase activity and compound inhibition are investigated using one or more of the three assay formats described below. The ATP concentrations for each assay are selected to be close to the Michaelis-Menten constant (K<sub>M</sub>) for each individual kinase. Dose-response experiments are performed at 10 different inhibitor concentrations in a 384-well plate format. The data are fitted to the following four-parameter equation:

$$Y = \text{Min} + (\text{Max} - \text{Min}) / (1 + (X/\text{IC}_{50})^H)$$

where Y is the observed signal, X is the inhibitor concentration, Min is the background signal in the absence of enzyme (0% enzyme activity), Max is the signal in the absence of inhibitor (100% enzyme activity), IC<sub>50</sub> is the inhibitor concentration at 50% enzyme inhibition and H represents the empirical Hill's slope to measure the cooperativity. Typically H is close to unity.

<sup>33</sup>P phosphoryl transfer assay:

[1443] Greiner 384-well white, clear bottom, high binding plates are coated with 2 µg/well of protein or peptide substrate in a 50 µL volume overnight at ambient temperature. The coating buffer typically contains 40 µg/mL substrate, 22.5 mM Na<sub>2</sub>CO<sub>3</sub>, 27.5 mM NaHCO<sub>3</sub>, 150 mM NaCl and 3 mM NaN<sub>3</sub>. The coating solution is aspirated and the plates are washed once with 50 µL of assay buffer and padded dry. Subsequently compounds and enzymes are mixed with γ <sup>33</sup>P-ATP (3.3µCi/nmol) in a total volume of 20 uL in suitable assay buffers. The mixture is incubated at ambient temperature for 1.5-2.5 hrs and terminated by aspiration using a Molecular Devices EMBLA 96-head plate washer. The plates are subsequently washed 6-12 times with PBST or TBS buffer. Scintillation fluid (50µl/well) is then added, the plates are sealed and activity assessed by liquid scintillation spectrometry using a Perkin Elmer MicroBeta TriLux.

Luciferase-coupled chemiluminescent assay (LCCA)

[1444] In the LCCA assays, kinase activity is measured as the percent ATP consumed following the kinase reaction using luciferase-luciferin-coupled chemiluminescence. Greiner 384-well white, clear bottom, medium binding plates are used for LCCA. Briefly, the kinase reaction is initiated by mixing compounds, ATP and kinase in a 20 uL volume. The mixture is incubated at ambient temperature for 2-4 hrs. At the end of the kinase reaction, a 20 uL luciferase-luciferin mix is added and the chemiluminescent signal is read using a Wallac Victor<sup>2</sup> reader. The luciferase-luciferin mix consists of 50 mM HEPES, pH 7.8, 8.5 ug/mL oxalic acid (pH 7.8), 5 (or 50) mM DTT, 0.4% Triton X-100, 0.25 mg/mL coenzyme A, 63 uM AMP, 28 ug/mL luciferin and 40,000 units of light/mL luciferase. For the LCCA assays, total ATP consumption has been standardized to 25-45% and the IC<sub>50</sub> values correlates well with those determined by radiometric assays.

AlphaScreen

[1445] AlphaScreen technology is a proximity assay which utilizes the increase in fluorescent signal when donor and acceptor beads are close in proximity. Biotinylated poly(Glu,Tyr) 4:1 is used as the kinase substrate, in conjunction with streptavidin-coated donor beads and anti-phosphotyrosine antibody PY100-coated acceptor beads. Upon phosphorylation, the peptide substrate can bind to both donor and acceptor beads giving

rise to an increase in fluorescence. Compounds, ATP, biotinylated poly(Glu, Tyr) and kinases are mixed in a volume of 20 uL for 1 hr at ambient temperature using Greiner 384-well white clear bottom medium binding plates. Following incubation a 10 uL solution containing 15-30 mg/mL AlphaScreen beads, 75 mM Hepes, pH 7.4, 300 mM NaCl, 120 mM EDTA, 0.3% BSA and 0.03% Tween-20 is added to each well. After 2-16 hr incubation of the beads, plates are read in a Perkin Elmer AlphaQuest reader. The IC<sub>50</sub> values correlates well with those of radiometric assays.

[1446] In order to assess the ability of the compound to abrogate the G2 checkpoint in cells (*via* Chk1 inhibition), a mitotic index assay can be performed. Mitotic index was determined by measuring accumulation of cells in mitosis in the presence of a DNA damaging agent (for example, Adriamycin; Adr). Nocodazole (Noc) was used to induce mitotic arrest. In the presence of Noc, cells accumulate in mitosis and are detected using an M-phase specific antibody. In the presence of Adr and Noc, cells undergo G2 arrest and do not proceed to M-phase. Addition of Chk1 inhibitors causes the G2 checkpoint to be bypassed, and M-phase cells are detected. HT-29 cells were cultured by 1:20 passaging in DMEM + 10% fetal bovine serum (DMEM/FBS) at 37° C and 5% CO<sub>2</sub>. Prior to the assay, cells were plated at 6500 cells/well in 100µl DMEM/FBS in black/clear bottom 96 well plates (BD Biocoat). After growing for 24 hours at 37° C/5% CO<sub>2</sub>, Adr was added to a final concentration of 250nM and cells were grown for a further 18-20 hrs. Medium was then aspirated from the plates and 70µl of 0.71µM Noc added in DMEM/FBS containing 0.55% v/v DMSO. Compounds were diluted in DMEM/FBS containing 0.55% v/v DMSO, and 30µl of compound solution added to the assay plates. Control wells with Noc, compound/Noc and Noc/Adr alone were also set up. Cells were grown for a further 18-20 hrs and visually inspected before fixing with formaldehyde. The percentage of mitotic cells was determined by immunofluorescence using a M-phase specific anti-phosphohistoneH3 rabbit polyclonal antibody and a goat anti-rabbit secondary antibody conjugated to Alexa Fluor 488 dye. Cell nuclei were also stained using Hoechst dye. Staining and fluorescence detection was performed using a Cellomics Arrayscan instrument, using the manufacturer's mitotic index assay kit. This is only one format of such assays, various other formats are possible, as known to those skilled in the art.

[1448] Table 12 shows structure activity relationship data for selected compounds of the invention with respect to Chk1 and a number of other enzymes, thus indicating selectivity of exemplary compounds of the invention toward Checkpoint kinases, particularly Chk1. Inhibition is indicated as IC<sub>50</sub> with following key: A = IC<sub>50</sub> less than 50 nM, B = IC<sub>50</sub> greater than 50 nM but less than or equal to 1000 nM, C = IC<sub>50</sub> greater than 1000 nM but less than 10,000 nM, and D = IC<sub>50</sub> of 10,000 nM or greater (a blank cell in the table indicates lack of data only).

(54) Title: PROTEIN KINASE MODULATORS AND METHODS OF USE

(57) Abstract: This invention relates to compounds for modulating protein kinase enzymatic activity for modulating cellular activities such as proliferation, differentiation, programmed cell death, migration and chemoinvasion, and to pharmaceutical compositions containing such compounds. Even more specifically, the invention relates to compounds that inhibit, regulate and/or modulate kinases, particularly Checkpoint Kinases, even more particularly Checkpoint Kinase 1, or Chk1. Methods of therapeutically or prophylactically using the compounds and compositions to treat kinase-dependent diseases and conditions are also an aspect of the invention, and include methods of treating cancer, as well as other disease states associated with unwanted angiogenesis and/or cellular proliferation, by administering effective amounts of such compounds.

## Box I Observations where certain claims were found unsearchable (Continuation of Item 1 of first sheet)

This international report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claim Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
2. ☒ Claim Nos.: 1-41 (in part), 43 (in part), 44, 49-56 (in part)  
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:  
Please See Continuation Sheet
3. ☒ Claim Nos.: 45-48  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of Item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
  2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
  4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:
- Remark on Protest ☐ The additional search fees were accompanied by the applicant's protest.  
☐ No protest accompanied the payment of additional search fees.

## Continuation of Box I Reason 2:

The present claims fail to comply with the clarity, conciseness, support and disclosure requirements of PCT Articles 5 and 6 to such an extent that a meaningful search for the full scope of the claims is impossible. Consequently, the search has been carried out for compounds specifically described in claim 42. The scope of "metabolite" in claim 44 is not all ascertainable since description provides no guidance as to structural makeup.
